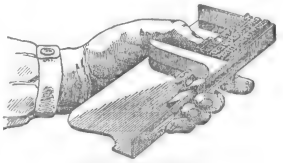
composing-frame (kọm-pō'zing-frām), *n.* Same as *composing-stand*.

composing-machine (kọm-pō'zing-ma-shēn'), *n.* A type-setting machine. The earliest composing-machine, invented by William Church in 1821, attempted to make the types as well as set them. This simultaneous making of the types is also the basis of more recent inventions; but some composing-machines are constructed to set types previously made. The types are specially nicked to fit them for automatic distribution. The arrangement of classified types in separate channels, and their dislodgement in order into a larger channel by means of levers touched from a finger-board, are features common to most composing-machines, widely as they may differ in other details of construction. The difficulty of separating or distributing the types for re-use has been a hindrance to the development of composing-machines. In the *linotype* (see the supplement), stereotyped lines of type are produced for use in printing.

composing-room (kọm-pō'zing-röm), *n.* A room in which types are set and made ready for printing.

composing-rule (kọm-pō'zing-röl), *n.* In *printing*, a thin piece of brass or steel fitted to the composing-stick, on or against which the compositor places and arranges the types. The smooth rule permits the free movement of type in the process of spacing, and it is also used as a support in the act of emptying the stick.

composing-stand (kọm-pō'zing-stand), *n.* In *printing*, an elevated framework, usually of wood, on which the type-cases are placed in inclined positions, the part for the upper case having a steeper slope than that for the lower. Also called *composing-frame*, or in common use *frame* or *stand*.



Composing-stick.

composing-stick (kọm-pō'zing-stik), *n.* In *printing*, a small tray of iron or other metal, with a raised side and end, which is held by a compositor in his left hand, and in which he places

and arranges the types that he picks out of the cases with his right hand. The composing-stick is fitted with a knee, adjustable, by means of a screw or a clamp, to any length of line required in printed work. The earliest composing-sticks were sticks of wood, with knees specially tacked on for different lengths of line; but wooden sticks are now used only in setting hand-bills, or for other work requiring very long lines.

Compositæ[1] (kom-poz'i-tē), *n. pl.* [NL., fem. pl. (sc. L. *plantæ*, plants) of L. *compositus*, composite: see *composite*.] A name employed by Adanson, and still in use by many botanists, for a very large group of plants with distinct natural affinities. The modern tendency among systematists is to consider the *Compositæ* as divisible into the three families *Cichoriaceæ*, *Ambrosiaceæ*, and *Asteraceæ* or *Carduaceæ*. As a whole the group comprises about 850 genera and 24,000 species, distributed all over the globe wherever vegetation is found, and divided equally between the old world and the new. They form about a tenth of all the flowering plants, an eighth of those of North America, and in some regions even a larger proportion. They are herbs, or much more rarely shrubs, scarcely ever arborescent, and are of comparatively slight economic importance. A few species are cultivated for food, as the artichoke (*Cynara*), the salsify (*Tragopogon*), and the lettuce (*Lactuca*); others have useful medicinal properties; and a very large number are cultivated for ornament. The flowers are gamopetalous and mostly pentamerous, sessile in a close head (the compound flower of early botanists, whence the name of the group), and surrounded by an involucre of separate or connate bracts. The ovary is inferior and one-celled, and becomes an achene in fruit, the calyx-limb being reduced to a circle of hairs, awns, scales, or teeth, called the *pappus*. The stamens are inserted on the corolla, and their anthers are united into a tube, on which account the name *Synantheræ* has been sometimes given to the group. The flowers are so characteristic that the term 'composite' as applied to any member of the three families is universally understood. The families are distinguished mainly by the shape of the corolla. The 10 largest genera of the group are the following: *Senecio* (1,000 species, largely American and African), *Eupatorium* (475 species, chiefly American), *Vernonia* (475 species, of tropical regions), *Centaurea* (350 species, of southern Europe and Asia Minor), *Baccharis* (275 species, largely South American), *Helichrysum* (250 species, of Africa and Australia), *Aster* (250 species, mostly North American), *Carduus* (250 species, widely distributed), *Artemisia* (200 species, also of wide distribution), and *Hieracium* (300 species, most abundant in the old world). The first nine genera mentioned belong to the family *Asteraceæ;* the genus *Hieracium*, to the *Cichoriaceæ*. See *Asteraceæ*, *Ambrosiaceæ*, and *Cichoriaceæ*, in the supplement.

In many *Compositæ* the florets of the ray or circumference differ in shape from those of the disc, being developed so as to look like petals.

These negatives are then printed so as to register together upon the same piece of paper, each being exposed to the light for the same fraction of the full time required for printing. It is believed that by study and comparison of such photographs made from large series of subjects, types of countenance, local, general, etc., can be obtained.—**Composite proof**, in *logic*, one involving several distinct inferences.—**Composite relation**, a relation satisfied if, and only if, some one of the component relations is satisfied. It is distinguished from an *aggregate relation*, which is satisfied if, and only if, all the partial relations are satisfied.—**Composite sailing**, in *navig.*, a combination of great-circle and parallel sailing.—**Composite whole**, in *metaph.*, a union of matter and form, or of act and power.

When a body is compressed into a smaller bulk its particles are brought into closer contact, while the quantity of matter remains the same. All bodies are compressible to a greater or less degree, gases being much more so than liquids or solids because of the greater distance between their particles. Thus air has been reduced by a pressure of 3,600 atmospheres to less than $\frac{1}{350}$ of its bulk at one atmosphere. The loss of volume of water under similar pressure would probably not exceed 15%.

conaria, *n.* Plural of *conarium.*

conarial (kō-nā′ri-ąl), *a.* [< *conarium* + *-al.*] Of or pertaining to the conarium, or pineal body of the brain.—**Conarial fossa**, a depression of the roof of the skull of some animals, in which the conarium is lodged.—**Conarial tube**, the more or less extended cavity or canal of the pineal body, now commonly supposed to be the remnant of the passage by which in vertebrates generally the primitive cavity of the myelencephalon communicated with the outer surface of the head. In man and the higher vertebrates generally the conarium appears to be deep-seated in the brain; but this is deceptive, and merely owing to the overgrowth of the cerebrum. The conarium is morphologically on the superior surface of the brain, whatever its apparent situation, and there is much reason to suppose that the large openings of the top of the skull in sundry Tertiary mammals, called the parietal foramina, indicate the extension of the conarial tube to the surface, and the formation there of a visual or other special-sense organ. On this view, the conarium is the vestige of an extinct eye. See *conarium.*

Dryden, Art of Poetry, iii. 475.

When we do our utmost to *conceive* the existence of external bodies, we are all the while only contemplating our own ideas. But the mind, taking no notice of itself, is deluded to think it can and doth *conceive* bodies existing unthought-of or without the mind; though at the same time they are apprehended by or exist in itself.
Bp. Berkeley, Human Knowledge, § 23.

To *conceive* a round square, or to *conceive* a body all black and yet all white, would only be to *conceive* two different sensations as produced in us simultaneously by the same object: a conception familiar to our experience; and we should probably be as well able to *conceive* a round square as a hard square, or a heavy square, if it were not that, in our uniform experience, at the instant when a thing begins to be round it ceases to be square, so that the beginning of the one impression is inseparably associated with the departure or cessation of the other.

When we would express our opinion modestly, instead of saying, "This is my opinion," or "This is my judgment," which has the air of dogmaticalness, we say, "I *conceive* it to be thus—I imagine or apprehend it to be thus"—which is understood as a modest declaration of our judgment. *Reid*, Intellectual Powers, p. 19.

pole of the curve, to the curve, the part of the line intercepted between the curve and a fixed line (now called its asymptote) is always equal to a fixed distance. The conchoid was used to facilitate the duplication of the cube. Its Cartesian equation is:

= **Syn.** *Concise*, *Succinct*, *Condensed*, *Laconic*, *Summary*, *Compendious*, short, terse, pithy, sententious, compact. The first four imply fullness of meaning as well as great brevity; the next two that the subject is treated by exhibiting only its main heads, and that therefore the treatment is comparatively brief. *Concise* frequently refers to style, and signifies the expression of much in few words; *succinct* is generally applied to the matter, the less important things being omitted: thus, a *concise* style or phrase, but a *succinct* narrative or account. *Condensed* relates more to the mode of treatment by which a matter is brought or compressed into a smaller space than it might have occupied. *Laconic* is applied to expressions which carry conciseness or brevity to an extreme. A *summary* account gives the principal points in the case; a *compendious* account is more sure than a *summary* account to give a complete and sufficient view of the subject.

Concords of two tones (also called *consonances*) are either *perfect* or *imperfect;* perfect concords include primes, fourths, fifths, and octaves, and imperfect include major and minor thirds and major and minor sixths. Concords of more than two tones contain only the above intervals between every pair of their constituent tones; but the triad, consisting of the 2d, 4th, and 7th of the scale when the 2d is in the lowest voice, is ranked as a concord, notwithstanding the dissonance between the 4th and 7th. (See *triad,* and *common chord,* under *chord,* 4.) Concords of two tones are acoustically distinguished from discords by the simplicity of the ratios between the vibration-numbers of the tones: thus, the ratios of the above concords are $\frac{1}{1}$, $\frac{2}{1}$, $\frac{3}{2}$, $\frac{4}{3}$, $\frac{5}{4}$, $\frac{6}{5}$, $\frac{8}{5}$, and $\frac{2}{1}$ respectively. Specifically—(*a*) Any device for reducing gases or vapors to liquid or solid form. The reduction is usually effected by lowering the temperature of the vapor by contact with chilled surfaces. A form of condenser common in the laboratory is shown in the figure. From the flask, *A*, the vapor to be condensed escapes through the tube *b c*, which passes through a larger condenser-tube. A stream of ice-water enters the condenser through *d*, and passes off through *g*, keeping the surface of the inner tube, *b c*, chilled, and the vapor entering the tube from *A* is condensed and drops from *c* as a liquid. Condensers used to concentrate vapors or gases, as steam, alcoholic vapors, fumes, volatile liquids, etc., commonly depend upon the reducing effects of a lower temperature. In them the vapor, gas, smoke, or fumes are brought into immediate contact with chilled surfaces. This is accomplished in a great variety of ways, as in the surface condenser of the steam-engine, the worm of a still, or the long convoluted tubes in which poisonous fumes or smoke are cooled before being allowed to escape to the chimney. The cooling surfaces are usually kept cold by water, as in the still, the gas-condenser, the sugar-condenser, etc. For fumes and smoke, the contact with walls exposed to the air is sufficient. (*b*) A part of a cotton-gin which compresses the lint for convenient handling. (*c*) In *wool-manuf.*, a machine which forms the wool received from the doffer of a carding-engine or comber, and rolls it into slubbings. The doffer of the carding-engine is covered by a series of parallel strips of card-clothing, wrapped about the cylinder. The wool thus comes off in a number of loose flat ribbons of fleece, which in the condensing-machine are carried by a leather apron beneath a roller which has a reciprocating motion transverse to their direction, and thus rolls these slivers into loose slubbings, which are wound upon a roll and are ready for spinning. (*d*) In the manufacture of sugar, the apparatus used for concentrating the clarified juice, preparatory to its final concentration in the vacuum or evaporating-pan. The liquor trickles over the surface of steam-pipes, where heat evaporates the water which constitutes the greater part of the cane-juice. (*e*) In optical instruments, a lens, or combination of lenses, used to gather and concentrate the rays of light collected by a mirror and direct them upon the object, as the bull's-eye condenser (see *bull's-eye*, 9) and the achromatic condenser used with the microscope.—**Achromatic condenser.** See *achromatic*.—**Condenser hygrometer**, a dew-point hygrometer. See *hygrometer*.—**Condenser of electricity**, any apparatus by which electricity can be accumulated, usually consisting of two conducting surfaces separated by a non-conductor, as in the condenser of Epinus (see figure), which is charged by connecting one of the plates (*A*) with the electrical machine and the other (*B*) with the ground; their distance from the glass plate (*C*) can be adjusted at will. A practical form of condenser is the Leyden jar (which see, under *jar*). Condensers are used in alternating-current circuits to produce leading currents, and then consist of plates of tin-foil separated by layers of paper which is filled with paraffin in a vacuum. Alternate plates of tin-foil are connected to the terminals of the condensers. For very high electric pressures mica is used as insulating material between the plates of tin-foil. Also an instrument, as the condensing electroscope, employed to collect and render sensible very small quantities of electricity. See *electroscope*.—**Hydraulic condenser.** See *hydraulic*.—**Surface condenser**, in a steam-engine, a condenser in which the exhaust-steam is distributed through a large number of pipes surrounded by cold water, which is constantly renewed.

The Scotists maintain that it is possible for man in his natural state so to live as to deserve the Grace of God, by which he may be enabled to obtain salvation, this natural fitness (congruitas) for grace being such as to oblige the Deity to grant it. Such is the merit of congruity. The Thomists, on the other hand, contend that man, by the divine assistance, is capable of so living as to merit eternal life, to be worthy (condignus) of it in the sight of God. In this hypothesis, the question of previous preparation for the grace which enables him to be worthy is not introduced. This is the merit of *condignity*." *Hook*, Eccles. Dict.

More specifically, a condition is a provision on the fulfilment of which depends the taking effect or continuance in effect of the instrument or some clause of it, or the existence of some right established or recognized by it, as distinguished from a *covenant*, which is a promise in a sealed instrument the breach of which may give rise to a claim for damages, but not necessarily the forfeiture of any right. The performance of a covenant, however, may be made a condition of the continued efficacy of the agreement. A *condition precedent* is a provision which must be fulfilled or an event which must occur before the instrument or clause affected by it can take effect. A *condition subsequent* contemplates that, after the instrument has taken effect, a right established or recognized by it may be extinguished by some future or uncertain event.

It is distinguished from convection, by which heat and electricity are carried by moving particles; from the radiation of heat, which does not raise the temperature of the intermediate points (except so far as the radiation is hindered); and from the discharge and the electrolytic transfer of electricity.

★**conductivity** (kon-duk-tiv'i-ti), *n.* [< *conductive* + *-ity*.] In *physics*, the power of conducting heat, electricity, or sound; the property of being conductive. In the case of heat (thermal conductivity) solids have in general a much higher degree of conductivity than liquids, and liquids than gases, the last being practically destitute of conductive power; both liquids and gases become heated by convection (which see), not by conduction. Furthermore, among solids the conductivity of metals for heat is greater than that of stony bodies, that of animal and vegetable substances being the least of all. Metals have also a relatively high degree of conductivity for electricity, a charge of electricity distributing itself freely over a metallic surface, and an electrical current passing more or less readily through a metallic wire. Those metals which are the best conductors of heat, as silver, copper, and gold, are also the best electrical conductors. The conductivity of many solids (glass, sulphur, resin) is nearly zero for electricity; the same is true to a less degree of most liquids and also of gases. With any substance the conductivity for electricity is the reciprocal of the specific resistance or resistivity, that is, it is the specific conductance or conductance per unit volume. See *resistance*.

[U. S.]—**6.** That which conducts or transmits in any manner; specifically, in *physics*, a body that conducts or transmits through its substance energy in any of its forms: as, metals are *conductors* of electricity and of heat; water is a good *conductor* of sound. The dental formula is, in each half jaw, 3 incisors, 1 canine, 4 premolars, and 3 molars. There is but one species, the star-nosed mole or shrew-mole, *C. cristata.* The name was really given from the knotted appearance of the tail in dried specimens, when the skin had shrunk on the bones, as represented in some figures of the animal in which the tail looks like a string of beads; it is, however, appropriate, since during the rut the tail swells to double its usual size, and has a gibbous appearance.

The clutch acts by frictional contact of these two conical surfaces.

packed one within another, as some limestones and marly strata, and very rarely beds of coal. The cone-in-cone structure is believed to be the result of pressure acting on concretions in process of formation, by which their rounded form is changed into a lengthened one, the concentric structure assuming under such circumstances the conical form.

Another illustration . . . is supplied by the so-called "lignilites," "epsomites," or "stylolites." . . . The same observer [Professor O. C. Marsh] has suggested that the more complex structure known as "*cone-in-cone*" may be due to the action of pressure upon concretions in the course of formation. *Geikie*, Textbook of Geology, p. 291.

characters); the snout produced, depressed, with inferior nostrils, and bald on top; the soles broad and entirely naked; the tail comparatively short and little bushy; and the colors massed in large areas. The type is the white-backed skunk or conepatl, found in Texas, Mexico, and southward; there are probably other species. Also called *Thiosmus*.

Conepatus is obviously the same as the old Mexican conepatl; . . . it probably refers to the burrowing of the animal; for it may be observed, nepantla in the Nahuatl language signified a subterranean dwelling.

Coues, Fur-bearing Animals (1877), p. 249.

cone-valve (kōn′valv), *n.* A valve with a conical face and seat.

cone-wheel (kōn′hwēl), *n.* A cone, or frustum of a cone, used as a means of transmitting power. A very common method of obtaining a change of speed is to use two cones with parallel axes, but with their bases in opposite directions, and connected by a belt moved at will by a shifter. When the belt is at the middle of the cones, supposing the two to be of equal size, the working diameters are equal, and the motion of the driver and driven is uniform. By shifting the belt to either side the relative speed of the driven cone may be increased or diminished. An intermittent or any irregular motion may be given by teeth placed in various positions upon the surfaces of the two cones, and so as to engage each other. See *cone-pulley*.

In fig. 1 two frustums are in apposition, one having teeth on its face and the other a spirally arranged row of studs. The frustum in fig. 2 when driven by the motor communicates motion to the wheel above it.

The confederation ultimately consisted of the following eleven States, which adopted ordinances of secession in the order given, the first on December 20th, 1860, and the last on May 20th, 1861: South Carolina, Mississippi, Florida, Alabama, Georgia, Louisiana, Texas, Virginia, Arkansas, Tennessee, North Carolina. They were readmitted to their former status as equal members of the United States after a little more than four years of civil war (the first actual hostilities occurring at Fort Sumter in South Carolina on April 12th, 1861, and the last in Texas on May 13th, 1865), and after a period of reconstruction and the acceptance of certain amendments to the federal Constitution, one of which abolished slavery. Woolsey, Introd. to Inter. Law, § 104.

Articles of Confederation, in *U. S. hist.*, the compact or constitution adopted by the Continental Congress in 1777 and ratified by the separate colonies within the next four years. The government formed under this compact, which went into effect on March 1st, 1781, was without an executive and judiciary, consisting simply of a congress of one house, in which each State had one vote; it was empowered to declare war and peace, make treaties with foreign powers, direct the land and naval forces in time of war, make requisitions upon the separate States for their quota of the money necessary for national expenses, regulate the value of coin, control the postal service, etc. As it had no power to enforce its laws upon the States, it soon fell into contempt, and on March 4th, 1789, expired by limitation under the provisions of the present Constitution.—**New England Confederation**, the union effected by the colonies of Massachusetts Bay, Plymouth, Connecticut, and New Haven in 1643, suggested by the need of a common defense against the Dutch and the Indians. It was discontinued in 1684.=**Syn.** *Confederation, Confederacy, Federation.* A *confederation* or *confederacy* is sometimes distinguished from a *federation* as follows: Both designate a union of distinct states. In a *federation*, however, the essential sovereignty, as exercised toward foreign countries, is regarded as irrevocably deposited in the hands of the central government, and only a constitutionally limited autonomy in internal matters is retained by the constituent territories; while in a *confederation* the sovereignty may be conceived as still existing in the constituents and exercised more or less extensively by the general government as delegated agent: a *confederacy* is regarded as even less permanent than a *confederation*. Thus, the union of the thirteen colonies before 1789 was a *confederation*, while the United States since that time have constituted a *federation*. The above distinction, however, is not strictly adhered to in the ordinary use of these words.

(*d*) In *common law*, an admission or acknowledgment of guilt. A *judicial confession* is a confession made in court, or before an examining magistrate. An *extra-judicial confession* is one made not in the course of legal prosecution for the offense, but out of court, whether made to an official or a non-official person. (*e*) In *Rom. law*, the admission by the defendant of the plaintiff's claim. It was either *in jure* (that is, before the pretor, and before the case had been referred to a judge to be tried) or *in judicio* (that is, made after the case had been so referred). **2.** In *liturgics*: (*a*) In many Oriental and early liturgies, a form of prayer acknowledging sinfulness and unworthiness, said by the priest before the celebration of the eucharist: also called the *apologia*. (*b*) In the Roman and other Latin masses, the Confiteor, or form of general acknowledgment of sins, said first by the celebrant and then by the assistants, and followed by the Misereatur and Indulgentiam before the priest ascends to the altar and proceeds to the Introit. (*c*) In the Anglican communion office, the form of general acknowledgment of sins made by the celebrant and the communicants. (*d*) In the liturgy of St. Chrysostom, and in the Alexandrine and other Oriental liturgies, the profession of faith, made before communicating, that the consecrated elements are really and truly the body and blood of Christ. —**3.** A formulary which comprises articles of religious faith; a creed to be assented to or signed as a preliminary to admission to the membership of a church, or to certain offices of authority in the church: usually called a *confession of faith*. The great confessions of faith of the Protestant Christian church are: the Augsburg Confession (1530), a part of the symbol of the Lutheran Church; the first and second Helvetic confessions (1536 and 1566), symbols of the Reformed churches of Switzerland, the latter being approved by nearly all the Reformed churches of the Continent and of England and Scotland; the Gallican Confession (1559), also called the Confession of Rochelle, prepared by Calvin and his pupil De Chandieu, the symbol of the French Protestant church; the Belgic Confession (1561, revised 1619), the symbol of the Reformed churches in Belgium and the Netherlands, and of the Reformed (Dutch) Church in the United States; the first Scotch Confession (1560) and the second Scotch Confession or the National Covenant (1581), the symbols of the Scotch church before the adoption of the Westminster Confession; the Thirty-nine Articles of the Church of England (1563 and 1571); the American revision of the same (1801), the symbol of the Protestant Episcopal Church in the United States; the Irish Article (1615) and the Lambeth Articles (1595), the symbols of the Church of Ireland; the Canons of the Synod of Dort (1619), at present recognized by the Dutch Church, and by the Reformed (Dutch) Church in the United States; the Westminster Confession (1647), the symbol of the Presbyterian Church in England, and of Scotland (taking the place in Scotland of the so-called Scotch confessions), and, with some alterations, of the Presbyterian Church of America; the Savoy Confession (1658), adopted by the Independents at the Savoy palace, London; the declaration of the Congregational Union of England and Wales (1833), of the Boston (United States) National Council (1865), and of the Oberlin National Council (1871), symbols of Congregational churches; the Articles of Religion (1784) of the Methodist Church; the Confession of 1688, and the New Hampshire Confession (1833), symbols of the Baptist Church. See *catechism, creed*. **4.** [ML. *confessio(n-)*.] The tomb of a martyr or confessor. If an altar was erected over the grave, the name was extended also to the altar and to the subterranean chamber in which it stood. In later times a basilica was sometimes erected over the chamber; the high altar was placed over the altar on the tomb below, and so this high altar also, and subsequently the entire building, was called a *confession*. Also called *confessional*, and in the Greek Church *catabasis* or *catabasion*.—**Auricular confession.** See *sacramental confession*, below.—**Confession and avoidance,** in *law*, the substance of a pleading by which the party admits the allegation of his adversary's pleading to be true, but states some new matter by way of avoiding its legal effect.—**Confession of faith.** See 3, above.—**Confession of judgment,** the acknowledgment of a debt by a debtor before a court or a justice of the peace, etc., on which judgment may be entered and execution issued.—**General confession.** (*a*) A confession made to a priest of sins committed by the penitent since baptism or since infancy, or for any long period, so far as those sins can be remembered; a confession made in preparation for baptism by one baptized after coming to years of discretion, also before admission to a monastic order. (*b*) [*cap.*] In the Book of Common Prayer: (1) The form of acknowledgment of sins to be said by the minister and the whole congregation at the beginning of Morning Prayer and Evening Prayer. (2) The form of confession in the Communion office.—**Judgment by confession,** a judgment obtained on a confession made to a court or a magistrate, or by the withdrawal of the defense, or against a plaintiff by nolle prosequi.—**Sacramental or auricular confession,** the act or practice of confessing sins to a priest, for the purpose of receiving absolution. At a very early period, for gross apostasy or other public sins, public confession was required as a condition precedent to partaking of the communion. Public confession was abolished for practical reasons. Auricular confession was always universally obligatory in the West. Confession and Communion at Easter were enjoined by the fourth Lateran Council A.D. 1215. It is required in the Roman Catholic Church from all who are conscious of mortal sins, and is regarded as essential to absolution and divine pardon, and a necessary prerequisite to partaking of the communion. Priests are bound in the strongest manner never to disclose a secret thus confided to them. Confession is obligatory in the Orthodox Greek and in the Armenian Church. The Anglican Church differs from the Roman Catholic and the Eastern Church in not making it obligatory, but leaving it to the conscience of the individual.—**Seal of confession,** in the *Rom. Cath.* and in the *Gr. Ch.*, absolute secrecy incumbent on a priest with regard to all private confessions of sins made to him. A similar secrecy is enjoined by the 113th canon of the Church of England. Also called *the seal*, and the *sacramental seal*.

In regard to opinion or belief it may mean no more than *sure*, or it may suggest reliance, as on one's own judgment or upon evidence: as, a *confident* expectation, hope, belief. It implies a desire for that of which one is *confident*. *Positive* runs close to over-confidence or dogmatism: as, he was *positive* that he had made no mistake; it expresses emphatic certainty that will not entertain a doubt of its correctness. (For *dogmatic*, see *magisterial*.) That *confident* and *positive* depend somewhat upon the will, and not merely, like *sure* and *certain*, upon the understanding, is shown by the fact that it is not correct to say "I will not be *certain*, or *sure*, about this," while it is correct to say "I will not be *positive*, or *confident*, about it."

(*e*) *Eccles.*: (1) A rite whereby baptized persons are admitted to full communion with the church. In the Roman Catholic, Greek, and Anglican churches it consists of the imposition of hands and prayer by a bishop (or in the Greek Church by episcopal authority), preceded in the two former by unction or anointing with chrism. In the first two churches it is regarded as the confirming or strengthening of the grace given in baptism and the bestowal of the gifts of the Spirit. In the Anglican Church, high-churchmen and low-churchmen regard it from different points of view, the latter attaching especial importance to the personal renewal made in it, by the persons confirmed, of the vows taken by others in their name at baptism, while the former believe it to be essentially a sacramental rite, conveying the strengthening power of the Holy Ghost. This rite is believed to be recorded in the New Testament as a laying on of hands following baptism, distinct from ordination, and administered by apostles only. Unction was discontinued in the Anglican Church not long after the Reformation. In the early church confirmation immediately followed baptism, and the Greek Church has always retained this practice; in the West, however, the two have been separated since the thirteenth century by an interval of seven years or more. Formerly confirmation was sometimes allowed to be administered by presbyters if authorized by the bishop; and this is still the case in the Greek Church. In the Latin Church the Pope can commission a priest to administer confirmation. Confirmation is one of the seven great religious rites, called *sacraments* by the Roman Catholic Church, *sacraments* or *mysteries* by the Greek. The Anglican formularies mention it as one of "five commonly called sacraments," but do not place these in the same rank with baptism and the Lord's supper as sacraments "ordained of Christ our Lord in the Gospel." (See *sacrament.*) In the Lutheran and Reformed churches the rite is administered by the pastors. Other Protestant denominations reject it.

The Fathers . . . held *confirmation* as an ordinance apostolic always profitable in God's Church.

Erected or maintained in honor of Confucius: as, a *Confucian* temple.

Confucianism (kon-fū'shian-izm), *n.* [< *Confucian* + *-ism.*] Properly, the ethico-political system taught by Confucius. He sought (unsuccessfully) to remedy the degeneracy and oppressions of his time, and to secure peace and prosperity to the empire, by the spread of learning and the inculcation of virtue, setting up as models to be imitated the "ancient kings" Yao and Shun (about 2356–2204 B. C.), who, by their virtue and the force of their individual character, were said to have removed evil, poverty, and ignorance from the empire. The system of Confucius was essentially mundane in its methods and aims, being based upon the proper discharge of the duties involved in the five relationships of life, namely, those of prince and subject, parent and child, brother and brother, husband and wife, and friend and friend. By many Confucianism is called one of the three religions of China, the others being Taoism and Buddhism. In this sense the term includes both the Confucian scheme of ethics and statecraft and the ancient native religion (for which the name *Sinism* has been proposed) existent in China from the dawn of Chinese history, and still observed as the state religion. Its chief features are: (1) the worship of the Supreme Being (Shang-ti) by the emperor on behalf of the people; (2) the worship of "the host of spirits," as the gods of the winds, of the rivers, of the mountains, the grain, etc., by the officials and dignitaries; and (3) the observance of ancestral worship and filial piety by all. (See *Sinism.*) By others the term has been still further extended, so as to include the cosmogonic speculations of Chu-hi and the other speculative philosophers of the twelfth century. The only Chinese term corresponding in any degree to the word *Confucianism* is *Yu-Kiao*, 'the system of the learned.'

Confucianism pure and simple is in our opinion no religion at all. The essence of *Confucianism* is an antiquarian adherence to traditional forms of etiquette — taking the place of ethics; a sceptic denial of any relation between man and a living God — taking the place of religion; while there is encouraged a sort of worship of human genius, combined with a set of despotic political theories. But who can honestly call this a religion? *China Rev.*, VIII. 59.

I use the term *Confucianism* . . . as covering, first of all, the ancient religion of China, and then the views of the great philosopher himself, in illustration or modification of it. *J. Legge*, Religions of China, p. 4.

5. The designation given to the party of Protestant Reformers during the reign of Mary. *N. E. D.*—**6.** In the *Rom. Cath. Ch.*: (*a*) One of the committees of cardinals appointed by the pope to aid him in the transaction of the business of the church. The decisions of these congregations are ordinarily regarded as equivalent to decisions of the pope himself. There are eleven regular congregations, namely: (1) the *Congregation of the Consistory*, which prepares the business to be brought before the consistory or assembly of all the cardinals (see *consistory*, 4); (2) the *Congregation of the Holy Office of the Inquisition*, which tries all cases of heresy brought before it, and formerly heard appeals from lower inquisitorial courts, and sent inquisitors where needed (see *inquisition*); (3) the *Congregation of the Index*, which decides what books shall be placed upon the Index Expurgatorius, or list of forbidden books (see *index*); (4) the *Congregation of Rites*, whose duty is to promote a general uniformity of the externals of divine worship, and to decide with regard to the beatification and canonization of any one whose name is proposed therefor; (5) the *Congregation of Immunities*, which is charged with the duty of determining all matters concerning the right of asylum, and such as relate to ecclesiastical jurisdiction where it comes in contact with the civil power; (6) the *Congregation of the Fabric*, which is charged with everything that relates to the conservation of St. Peter's; (7) the *Congregation of the Council* (that is, of Trent), which is the official interpreter of the decrees of the Council of Trent on all matters of discipline whenever questions arise thereon, the interpretation of its articles of faith being reserved to the pope himself; (8) the *Congregation of Bishops and Regulars*, which disposes of such differences as may arise between the bishops and the regular communities within their respective dioceses; (9) the *Congregation of Discipline*, which superintends the interior discipline of monastic establishments; (10) the *Congregation of the Propaganda*, which has charge of the missions of the church, and of the College of Propaganda, an institution at Rome for the instruction of men intended for missionary work (see *propaganda*); (11) the *Congregation of Indulgences*, which superintends the examination and certification of the authenticity of relics and the grant of indulgences. Other special congregations are also appointed by the pope. *Cath. Dict.* (*b*) A religious community bound together by a common rule, but not by the solemn and irrevocable vows which characterize the monastic orders. Among them are the Oratorians, the Dames Anglaises, the Fathers of the Mission or Lazarists, the Oblates, the Passionists, the Redemptorists, the Marists, and the Christian Brothers. (See *Christian Brothers*, under *Christian*[1].) (*c*) A group of monasteries which agree to practise the rules of their order more strictly in their respective houses, and unite themselves together by closer ties, such as the congregations of Cluny and St. Maur.

As a broad general rule, nearly every post-Reformation institute is styled, not an "Order," but a "*Congregation*"; but the only distinction which can be drawn between these two names is that "order" is the wider, and may include several *congregations* within itself (as the Benedictine order, for example, includes the *congregations* of Cluny and of St. Maur), while a *congregation* is a simple unit, com-

plete in itself, and neither dependent on another institute nor possessed of dependent varieties of its own.
Encyc. Brit., XVI. 715.

(*d*) A committee of bishops appointed by the pope, or with his approbation, to prepare rules of business, etc., for a general council. In the General Council of Constance the congregation was differently constituted, the Council being divided into congregations according to the nationalities represented—German, French, Italian, English, and subsequently Spanish. These voted separately, preliminary to the final action of the Council as a whole.

They denied the authority of the Bible and the truth of important Christian doctrines, and some of them also the existence of a personal Deity. As they became politically powerful, they were suppressed in Saxony and Bavaria, and continued to exist in Prussia only under great difficulties. There are some of these congregations in the United States.—**Lords of the Congregation**, in *Scot. ch. hist.*, a title given to the chief nobles and gentlemen who signed the Covenant of December 3d, 1557, for liberty of worship. The whole body of adherents was called *the Congregation*, from the frequent recurrence of the word *congregation* in the document. = **Syn. 4.** See *spectator*.

congregational (kong-grē-gā′shon-al), *a.* [< *congregation* + *-al.*] **1.** Of or pertaining to a congregation: as, *congregational* singing.—**2.** *Eccles.*, pertaining to government by congregations; governed by its own congregation, as a church; specifically (with a capital), pertaining to Congregationalism as a denominational designation: as, the *congregational* polity of the Baptists; the *Congregational* churches of the United States.

The great Baptist denomination—with some leaning toward Independency properly so called—is yet purely *Congregational* in its principle of church order and government. *H. M. Dexter*, Congregationalism (2d ed.), i.

congregationalism (kong-grē-gā′shon-al-izm), *n.* [< *congregational* + *-ism.*] **1.** A system of church government based upon the autonomy of the individual congregation. It embodies three fundamental principles—(1) that it is the right and duty of believers in Jesus Christ in every community to organize for Christian work and worship, and that such an organization is a Christian church; (2) that each such church is by right independent of all external ecclesiastical control, and in any such church all members possess equal ecclesiastical authority; (3) that such churches owe a duty of Christian fellowship and coöperation to one another. This fellowship and coöperation is exercised among those who bear the name of Congregationalists by means of councils, conferences, consociations, and associations. The principles of congregationalism are maintained not only by Congregationalists so called, but also by Baptists, Unitarians, Universalists, and some other denominations of Christians, and by many evangelical churches in France, Switzerland, etc.

Congregationalism is the democratic form of church order and government; it derives its name from the prominence which it gives to the congregation of Christian believers. It vests all ecclesiastical power (under Christ) in the associated brotherhood of each local church, as an independent body. At the same time it recognizes a fraternal and equal fellowship between these independent churches, which invests each with the right and duty of advice and reproof, and even of the public withdrawal of that fellowship in case the course pursued by another of the sisterhood should demand such action for the preservation of its own purity and consistency. Herein *Congregationalism* as a system differs from Independency, which affirms the seat of ecclesiastical power to reside in the brotherhood so zealously as to ignore any check, even of advice, upon its action.
H. M. Dexter, Congregationalism (2d ed.), i.

2. [*cap.*] The system of ecclesiastical polity and religious doctrine maintained by the Congregational Church. See *congregationalist*, 2.

congregationalist (kong-grē-gā′shon-al-ist), *n.* [< *congregational* + *-ist.*] **1.** One who holds to the congregational principles of church government. See *congregationalism*, 1. In this sense, Baptists, Unitarians, Universalists, some Methodists, and some other denominations of Christians are congregationalists.

2. [*cap.*] One of a denomination of Christians who hold to the congregational principle of church government, to the system of doctrines known as evangelical or orthodox, to the legitimacy of the baptism of infants, and to baptism by sprinkling. The Congregationalists of the United States are identical in origin and general principles with the Independents (now also called *Congregationalists*) of Great Britain. They were the predominant religious body in the first settlement of New England, and have thence spread over the United States, especially in the Northern and Middle States. Their churches are independent of one another; their various ecclesiastical assemblies—councils, conferences, consociations, associations—possess no ecclesiastical authority, but only a moral power; and they are generally moderate Calvinists in theological doctrines. Their missionary operations are carried on by means of voluntary societies supported by the churches, but only indirectly amenable to them.

Dryden, Æneid, x.

2. The meeting of persons in sexual commerce. —**3.** A formal meeting or association of persons having a representative character; an organization or authorized assemblage of persons for the consideration of some special subject or the promotion of some common interest; particularly, in *politics*, an assemblage of envoys, commissioners, or plenipotentiaries representing sovereign powers, or of sovereigns themselves, for the purpose of arranging international affairs: as, the *Congress* of Vienna (1814–15); the *Congress* of Paris (1856). For the distinction between *conference* and *congress*, see extract under *conference*, 2 (*a*).

As soon as the employers attempted to give work to subcontractors, they forced them by strikes to take it back. The society [of hatters] was called the *Congress*, was regulated by statutes, and framed bye-laws. All workmen of the trade belonged to it.
English Gilds (E. E. T. S.), Int., p. clxxviii.

The *congress* of Aix la Chapelle, at which the five great powers were represented, . . . was intended to exercise a supervisory power over European affairs, interfering to prevent all dangerous revolutions, especially when they should proceed from popular movements.

Farmers' *congress*, an association of agriculturists of the United States, which has met annually since 1881.
Appleton's Ann. Cyc., 1886, p. 330.

4. [*cap.*] The national legislature of the United States. In *U. S. hist.* there have been three differently constituted bodies so named: (*a*) The *Continental Congress*, representing the thirteen colonies. What is known as the first Continental Congress, with delegates from all the colonies but Georgia, met in Philadelphia September 5th, 1774, and lasted until October 26th, 1774; the second, in which all were represented, met in Philadelphia May 10th, 1775, and adjourned December 12th, 1776; the third met in Baltimore December 20th, 1776, and lasted until the Articles of Confederation went into operation, March 1st, 1781. (*b*) The *Congress of the Confederation*, representing the States under the Articles of Confederation, March 1st, 1781, to March 4th, 1789. (*c*) The *Congress of the United States*, which represents both the States and the people under the Constitution, and which met for the first time March 4th, 1789. It consists of two houses, the Senate and House of Representatives (sometimes called the upper and lower houses), and meets at least once every year. The Senate is composed of two members from each State, elected (by popular vote) for a period of six years, one third of them being elected every second year. The number of representatives varies in each State in proportion to the population. (See *apportionment*, 2.) They sit for two years only. The united body, for the two years during which the representatives hold their seats, receives a numerical designation as a single Congress, counting from the first. Thus, the senators and representatives sitting during the period March 4, 1909, to March 4, 1911, constituted the 61st Congress. The most important powers of Congress, as enumerated in the Constitution, are: to impose and collect taxes, borrow and coin money, regulate commerce, establish uniform naturalization and bankruptcy laws, declare war, raise armies, maintain a navy, suspend the writ of habeas corpus, admit new States, and make all laws necessary to carry these powers into execution. In addition, the Senate confirms or rejects treaties, and nominations to office made by the President.

The substitution of "*Congress*" for "the legislature of the United States," requires no explanation. It is a mere change of phraseology. *Calhoun*, Works, I. 256.

The upper house of *Congress* is therefore a federal while the lower is a national body, and the government is brought into direct contact with the people without endangering the equal rights of the several states.
J. Fiske, Amer. Pol. Ideas, p. 97.

5. The name of the lower house of the Spanish Cortes, and of the national legislatures of the South American republics.—**Church Congress**, a name applied to two voluntary organizations, one in the Church of England, the other in the Protestant Episcopal Church in the United States of America, for the free discussion of topics of church interest. Membership is confined to those who are in communion with the church. Neither body possesses any ecclesiastical authority or responsibility, or attempts any legislative functions. The same name, with modifying adjectives, as *Inter-ecclesiastical Congress, Inter-denominational Congress*, etc., has been applied to other bodies of a similar character embracing members of various Protestant communions.—**Congress boots.** See *boot*².—**Congress water.** See *mineral water*, under *mineral*.—**Peace Congress**, in *U. S. hist.*, a conference, in February, 1861, of delegates from free and border slave States, which made unsuccessful efforts to avert civil war by means of proposed amendments to the Constitution, dealing chiefly with slavery. Also called *Peace Convention* or *Conference*.—**Provincial congresses**, popular conventions which, at the beginning of the struggle between the American colonies and England, assumed control of the colonies.—**Stamp-Act Congress**, a body of delegates from nine colonies which met at New York, in 1765, to protest against the Stamp Act and other oppressive measures of the British Parliament.

(*a*) By some authors it is extended to include the *Ophichthyidæ* and some others, as well as the true *Congridæ*. (*b*) By others it is restricted to the genus *Conger* and those closely agreeing with it. As thus limited, it is closely allied to the family *Anguillidæ*, but differs in the more developed palatopterygoid arches and opercular apparatus, and the advanced dorsal fin. The species are exclusively marine.

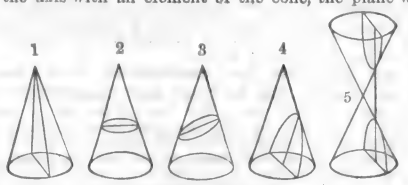
2. Specifically, in *math.*, of or pertaining to a cone: as, *conic* sections.—**Conic section** [NL. *sectio conica*, Gr. κωνικὴ τομή], a curve formed by the intersection of a plane with a right circular cone. If the inclination of the axis of the cone to the cutting plane be greater than the angle made by the axis with an element of the cone (fig. 3), the intersection is finite and is called an *ellipse*. The circle is one limiting form of the ellipse—that, namely, in which the plane becomes perpendicular to the axis of the cone. If the inclination of the axis of the cone to the cutting plane be less than the angle made by the axis with an element of the cone, the plane will



Conic Sections.

The two principal forms are fig. 5, giving the hyperbola, and fig. 3, giving the ellipse. Fig. 4 is the intermediate case, giving the parabola. The degenerate form of the hyperbola is a pair of straight lines, as shown in fig. 1. Fig. 2 shows the circle as a special case of the ellipse having no special relations to the infinitely distant part of the real plane, though it passes through two fixed imaginary points on the line at infinity.

also cut the second sheet of the cone on the other side of the apex (fig. 5), and the twofold curve thus generated is a *hyperbola*. A particular case of the hyperbola, produced when the plane passes through the apex of the cone, is that of two intersecting straight lines, called a *degenerate conic*. Intermediate between the ellipse and the hyperbola is the case where the plane is parallel to an element of the cone (fig. 4), and the curve thus produced is a *parabola*. The degenerate form of the ellipse is a point, that of the parabola a straight line. The degenerate forms are not true conics.—**Spherical conic section**, a curve produced by the intersection of a sphere with a cone.

Conical bearing. See *bearing*.—**Conical gearing.** See *gearing*.—**Conical map-projection**, the projection of the earth first upon a tangent or secant cone with the subsequent development of the cone. The best-known conical projection is Bonne's, used for the map of France. "In constructing a map on this projection, a central meridian and a central parallel are first assumed. A cone, tangent along the central parallel, is then assumed, and the central meridian developed along that generator of the cone which is tangent to it, and the cone is then developed on a tangent plane. The parallel falls into an arc of a circle with its center at the vertex, and the meridian becomes a graduated right line. Concentric circles are then conceived to be traced through points of this meridian at elementary distances along its length. The zones of the sphere lying between the parallels through these points are next conceived to be developed, each between its corresponding parallels. Thus all the parallel zones of the sphere are rolled out on a plane in their true relations to each other and to the central meridian, each having in projection the same width, length, and relation to the neighboring zones as on the spheroidal surface. As there are no openings between consecutive developed elements, the total area is unaltered by the development. Each meridian of the projection is so traced as to cut each parallel in the same point in which it intersected it on the sphere." *Craig*, Treatise on Projections, p. 72.—**Conical point**, in *geom.*, a point on a surface such that every line through it meets the surface in two coincident points.—**Conical pupæ** or **chrysalides**, in *entom.*, those pupæ or chrysalides which have no angular processes, and are more or less conical in form. This is the common type among nocturnal *Lepidoptera*.—**Conical refraction.** See *refraction*.—**Conical surface**, any surface generated by the motion of a right line having one point fixed.—**Conical valve**, the puppet-valve or T-valve, first used by Watt in the construction of his engines. It consists of a circular plate of metal having a beveled edge accurately fitted to a seat.

Coniferæ (kō-nif′ē-rē), *n. pl.* [NL., fem. pl. of L. *conifer*, cone-bearing: see *conifer.*] A name still used by many authors to denote the principal order of gymnospermous plants, the *Pinales.* It exceeds every other order in the value of its timber-supply and of its resinous products. It is cosmopolitan, but is especially abundant in temperate and mountainous regions, often forming in the northern hemisphere vast forests. It consists of trees or shrubs, mostly evergreen and resinous, usually with subulate (awl-shaped), needle-shaped, or scale-like rigid leaves, and with monœcious or rarely dicœcious naked flowers. The male flower consists of an indefinite number of stamens upon a central axis, the anthers being frequently suspended from the under side of a peltate scale. The fertile ament consists of scales bearing naked ovules, and in fruit becomes a dry cone or is fleshy and drupe-like. The embryo has often several cotyledons in a whorl. The wood, as in all gymnosperms, is characterized by having the sides of the cells dotted with what are called bordered pits or discoid markings. The order includes about 32 genera and 325 species, and is divided into the two families *Pinaceæ* and *Taxaceæ*, the latter distinguished by the fleshy outer integument of the ovule. The *Taxaceæ* include the tribe *Podocarpeæ*, consisting of African and Australasian genera, and the tribe *Taxeæ*, the true yews. The principal divisions of the *Pinaceæ* are as follows: (*a*) *Abietieæ*, bearing cones formed of spirally imbricated two-seeded scales; to this belong the pine, fir, spruce, larch, cedar, etc. (*b*) *Araucarieæ*, with similar cones having one or several seeds to each scale, represented by *Araucaria* and *Dammara* in the southern hemisphere, and by two monotypical genera in China and Japan. (*c*) *Taxodieæ*, including the big-tree of California (*Sequoia*), the bald cypress (*Taxodium*), and a few species of Australia and Japan. (*d*) *Cupressieæ*, having cones with decussately opposite scales, or sometimes drupe-like, as the cypress, juniper, arbor-vitæ, and the North American cedars. True conifers first appear in the Carboniferous measures, and continue upward through all subsequent formations.

=**Syn.** *Imagine*, *Conjecture*, *Surmise*, *Guess*, *Presume*, fancy, divine. *Imagine* literally expresses pure speculation, and figuratively expresses an idea founded upon the slightest evidence: as, I *imagine* that you will find yourself mistaken. *Conjecture* is something like a random throw of the mind; it turns from one possibility to another, and perhaps selects one, almost arbitrarily. *Surmise* has often the same sense as *conjecture;* it sometimes implies a suspicion, favorable or otherwise: as, I *surmise* that his motives were not good. *Guess* suggests a riddle, the solution of which is felt after by the mind—a question, as to which we offer an opinion, but not with confidence, because the material for a judgment is confessedly insufficient. To *presume* is to base a tentative or provisional opinion on such knowledge as one has, to be held until it is modified or overthrown by further information.

The sylphs through mystic mazes guide their way.

2. In *gram.*, to inflect (a verb) through all its various forms, as voices, moods, tenses, numbers, and persons, or so many of them as there may be. This use has its origin in the fact that in inflected languages a verb is conjugated by *conjoining* certain inflectional syllables with the root.

II. *intrans.* In *biol.*, to perform the act of conjugation; specifically, in *bot.*, to unite and form a zygospore or similar sexual spore.

II. *n.* **1.** In *gram.* and *rhet.*, one of a group of words having the same immediate derivation, and therefore presumably related in meaning; a paronym. Abp. Bramhall, Answer to Hobbes.

2. In *chem.*, a subordinate radical associated with another, along with which it acts as a single radical.—**3.** A conjugate axis.—**Conjugate of a quaternion**, another quaternion having the same scalar and the vector reversed.—**Harmonic conjugates.** Two points are harmonic conjugates with respect to two others which they harmonically separate. If four points, A, B, C, D, in a straight line are at such distances that $\frac{AC}{CB} \div \frac{AD}{DB} = -1$, then C and D are said to be *harmonic conjugates* with respect to A and B, and vice versa.

2. In *gram.*: (*a*) The inflection of a verb in its different forms, as voices, moods, tenses, numbers, and persons; a connected scheme of all the derivative forms of a verb. (*b*) A class of verbs similarly conjugated: as, Latin verbs of the third *conjugation*. (*c*) In Hebrew and other Semitic languages, one of several groups of inflections normally formed from the same verb, and expressing a modification of meaning analogous to that found in certain classes of derivative verbs in Indo-European languages, or to the voices of these. [The Latin *conjugatio* is a translation of the Greek *συζυγία*, properly *derivation*, including inflection as well as formation of new words, but afterward limited to the inflection of verbs, which had previously been called simply *inflection*, or *inflection of verbs* (*κλίσις ῥημάτων*, *declinatio verborum*).]

3. A union or coupling; a combination of two or more individuals. [Obsolete except in specific use. See 4.]

The sixth *conjugation* or pair of nerves.
Sir T. Browne, Vulg. Err., iv. 4.

4. In *biol.*, a union of two distinct cells for reproduction; a temporary or permanent growing together of two or more individuals or cells, with fusion of their plasmodic substance, as a means of reproduction by germs or spores, or a means of renewing individual capacity to multiply by fission. It is a kind of copulation of the entire bodies of different individuals or cells, with the formation of new nuclei or other form-elements, preparatory to the development of new individuals. It is also called *zygosis*, and the resulting blended organism is called a *zygote* or *zygospore*. The process occurs only in the lower animals and plants, among many of which it is an ordinary mode of reproduction. It is very common in protozoans, and has been observed in certain worms. (See *Diplozoön*.) A permanent fusion takes place in the unicellular algæ *Diatomaceæ* and *Desmidiaceæ* by the union of the contents of two separate cells; in the *Zygnemaceæ* and *Mesocarpeæ*, by that of two cells of different filaments or of the same filament; and in the *Zoösporeæ*, by that of zoöspores from different mother-cells. The result of the union of non-motile cells is a *zygospore*, which may produce a plant similar to that from which it came. The process is considered a sexual one, though the cells which unite cannot be distinguished as male and female.

1. Portions of two filaments preparing for conjugation; a protuberance has arisen from each cell to meet a similar one from the opposite cell. *a*, *A*, portions of two filaments whose cells are in the act of conjugating. At the left the protoplasmic body of one cell is passing through and coalescing with that of the opposite cell; at the right this has already taken place. *B*, portion of a filament containing young zygospores, each surrounded by a cell-wall. (From Sachs's "Lehrbuch der Botanik.")

The *conjugation* of the Algæ and of some of the simplest animals is the first step towards sexual reproduction.
Darwin, Cross and Self Fertilisation, p. 409.

The *conjugation* of two Infusoria occurs in very different ways, and leads to more or less complete fusion, which, after regeneration of the nucleus, is followed by an increase in the frequency of fission. Paramœcium, Stentor, Spirostoma, during *conjugation*, become connected by their ventral surfaces; other Infusoria, with a flat body like Oxytrichina or Chilodon, by their sides; while Enchelys, Halteria, Coleps, join together the anterior extremities of their bodies, giving the appearance of transverse fission. A lateral *conjugation* also takes place not infrequently in Vorticella, Trichodina, etc., between individuals of unequal size, the smaller one having the appearance of a bud. *Claus*, Zoölogy (trans.), I. 203.

2. In *astron.*, the meeting of two or more stars or planets in the same longitude or right-ascension: as, the *conjunction* of the moon with the sun, or of Jupiter and Saturn. When a planet, as seen from the earth, is in the same direction as the sun, it is said to be in *conjunction* with the sun. This, however, in the case of an inferior planet, may be either when it passes between the sun and the earth or when it is on the farther side of the sun; the former is the *inferior* and the latter the *superior conjunction*. A superior planet can be in conjunction with the sun only when beyond the sun. See *syzygy* and *opposition*.

3. In *gram.*, a connective particle serving to unite clauses of a sentence, or coördinate words in the same sentence or clause, and indicating their relation to one another. There are two principal kinds of conjunctions, *coördinating* and *subordinating*: the former joining clauses of equal order or rank (as, he went *and* I came); the latter joining a subordinate or dependent clause to that on which it depends (as, I went *where* he was; he was gone *when* I came). Most conjunctions are of adverbial origin, and some, as, for instance, *also*, share almost equally the character of both parts of speech.—**Comparative conjunction, conditional conjunction, copulative conjunction,** etc. See the adjectives.—**Ecliptic conjunction.** See *ecliptic.*—**Partile conjunction†**, an exact conjunction.—**Platic conjunction†**, a conjunction within the planets' orbs.

In birds and many reptiles and mammals it forms a special fold, chiefly constituting the nictitating membrane or third eyelid. It is very delicate where it passes over the cornea, offering no impediment to vision. In snakes which have no eyelids a delicate cuticle continues from the skin over the eye, and is shed with the rest of the cuticle. The membrane is regarded as one of the tunics or coats of the eyeball, like the tunica sclerotica, etc. **2.** In *entom.*, the membrane uniting two sclerites, or hard parts of the integument, which move freely on each other.

In regard to the word black, we merely annex to it the syllable ness; and it is immediately indicated that all *connotation* is dropped. *James Mill*, Human Mind, ix.

2. That which constitutes the meaning of a word; the aggregation of attributes expressed by a word; that which a word means or implies: distinguished from *denotation*. See extract, and *connote*, *v.*

The more usual mode of declaring the *connotation* of a name is by predicating two or more connotative names which make up among them the whole *connotation* of the name to be defined, as, Man is a corporeal, organized, animated, rational being, shaped so and so; or we may employ names which connote several of the attributes at once, as, Man is a rational animal shaped so and so.
J. S. Mill, Logic, I. viii. § 2.

connotative (ko-nō′ta-tiv), *a.* [= F. *connotatif* = Sp. Pg. *connotativo*, < ML. *connotativus*, < **connotatus*, pp. of *connotare*, connote: see *connote*, *connotate*.] Having the quality of connoting; implying an attribute while denoting a subject: applied to any term which connotates or connotes anything, in whatever sense those verbs may be used. [The Latin equivalent *connotativus* is frequent in the scholastic writers, from Alexander of Hales, one of the earliest, who gives *relativa appellatio* as the equivalent of *nomen connotans*, to William of Occam, who says: "A *connotative* name is that which signifies one thing primarily and another secondarily; and such a name properly has a nominal definition, . . . and frequently a part of that definition ought to be placed in the nominative and part in an oblique case, . . . as with the noun *white*, . . . that which possesses whiteness." The word is used in this sense in older English writers. Several modern writers, as James Mill, have used it in nearly the same way; but J. S. Mill's influence has established, alongside of the old meaning, another, used by his followers, which is defined in the following extract:

A *connotative* term is one which denotes a subject, and implies an attribute. By a subject is here meant anything which possesses attributes. Thus John, or London, or England, are names which signify a subject only. Whiteness, length, virtue, signify an attribute only. None of these names, therefore, are *connotative*. But white, long, virtuous are *connotative*. The word white denotes all white things, as snow, paper, the foam of the sea, etc., and implies, or, as it was termed by the schoolmen, connotes, the attribute whiteness. *J. S. Mill*, Logic, I. ii. § 5.]

Connotative being. See *being*.

connote (kọ-nōt′), *v.*; pret. and pp. *connoted*, ppr. *connoting*. [= Sp. *connotar*, < ML. *connotare*, connote, < L. *com-*, together, + *notare*, mark, note: see *note*, *v.*, and cf. *connotate*.] **I.** *trans.* 1. Same as *connotate*.

Good, in the general sense of it, *connotes* also a certain suitableness of it to some other thing. *South.*

White, in the phrase white horse, denotes two things, the color and the horse; but it denotes the color primarily, the horse secondarily. We say that it notes the primary, *connotes* the secondary signification.
James Mill, Human Mind, i.

2. To signify; mean; imply.

It [*Cosmos*] denotes the entire phenomenal universe; it *connotes* the orderly uniformity of nature, and the negation of miracle or extraneous disturbance of any kind.
J. Fiske, Cosmic Philos., I. 182.

[This meaning was introduced by J. S. Mill. A word *connotes* those attributes which its predication of a subject asserts that that subject possesses. But *connote* is now often loosely used in such a sense that any attribute known to be possessed by all the objects denoted by a term is said to be *connoted* by that term. Mill discountenances this use of the word.

In some cases it is not easy to decide precisely how much a particular word does or does not *connote;* that is, we do not exactly know (the case not having arisen) what degree of difference in the object would occasion a difference in the name. Thus, it is clear that the word man, besides animal life and rationality, *connotes* also a certain external form; but it would be impossible to say precisely what form; that is, to decide how great a deviation from the form ordinarily found in the beings whom we are accustomed to call men would suffice in a newly discovered race to make us refuse them the name of man.
J. S. Mill, Logic, I. ii. § 5.]

= **Syn.** *Note*, *Denote*, *Connote*. See the definitions of these words.

II. *intrans.* To have a meaning or signification in connection with another word.

=**Syn. 1** and **3**. *Overcome, Vanquish, Conquer, Subdue, Subjugate*, to overpower, overthrow, defeat, beat, rout, worst, discomfit, humble, crush, subject, master, agree in the general idea expressed by *overcome*, namely, that of becoming superior to by an effort. The most conspicuous use of these words is in relation to physical struggles, as in war, wrestling, etc., but they refer also to struggles of mind, as in statesmanship, debate, chess, etc. An important difference among them is the implied duration of the victory, *overcome* and *vanquish* not reaching beyond the present, *conquer* implying a good deal of permanence, and *subdue* and *subjugate* containing permanence as an essential idea. *Overcome* is not so strong as *vanquish*, the former expressing a real victory, but the latter also a complete or great one. *Conquer* is wider and more general than *vanquish*, and may imply a succession of struggles or conflicts, while *vanquish* and *overcome* refer more commonly to a single conflict. Alexander the Great *conquered* Asia in a succession of battles, and *vanquished* Darius in one decisive engagement. In this respect *subdue* and *subjugate* are like *conquer*. *Subdue* may express a slower, quieter process than *conquer*. *Subjugate* is the strongest; it is to bring completely under the yoke. See *defeat*.

Who *overcomes*

There can be no doubt that the military tenure, the most prominent feature of historical feudalism, was itself introduced by the same gradual process which we have assumed in the case of the feudal usages in general. Consecration makes not a place sacred, but only solemnly declares it so. *South*.

Specifically—**2.** *Eccles.*: (*a*) The act of conferring upon a priest the powers and authority of a bishop; the rite or ceremony of elevation to the episcopate. In the Roman Catholic, in the Greek and other Oriental churches, and in the Anglican Church, imposition of hands by a bishop for the purpose of making the candidate a bishop is held to be essential to consecration, and the rule is that at least three bishops shall unite in the act, as directed by the fourth canon of the first Council of Nicæa, A. D. 325.

Only papal authority could loose the tie that bound the bishop to the church of his *consecration*.
Stubbs, Const. Hist., § 383.

According to the Roman Catholic and the Anglican Church the essential act of eucharistic consecration consists in the recital of the words of institution over the elements by a priest. (*c*) The prayer used to consecrate the eucharistic elements. It was customary to consecrate each of these crosses with chrism, and to recite a special prayer, and perhaps to incense each one; in some cases the cross was cut subsequently in a place which the officiant had consecrated in this manner. In the Greek Church three larger crosses are cut upon the altar-slab instead of five, and the pillars supporting the altar also receive crosses. See *altar-board*.

consecrator (kon'sē-krā-tor), *n.* [= F. *consécrateur* = It. *consecratore*, < LL. *consecrator*, < L. *consecrare*, pp. *consecratus*, consecrate: see *consecrate*, *v.*] One who consecrates.

Which his grace accepteth, as touching your merits and acquittal, in no less good and thankful part than if ye, finding the disposision of things in more direct state, had *consecuted* all your pursuits and desires.
Bp. Burnet, Records, ii. 23.

2. To overtake or gain by pursuit; attain.

Few men hitherto, being here in any auctoritie, hath finally *consecuted* favors and thankes, but rather the contrarie, with povertie for theire farewell.
State Papers, ii. 389. (*Nares*.)

Consecutions . . . evidently found in the premises.
Sir M. Hale.

In every [argument concerning religious belief] . . . sooner or later there comes a point where strict logical *consecution* fails, and where the passage is made from premise to conclusion by an appeal to faith and feeling or some other illogical element. *B. P. Bowne*.

The conception of *consecution* itself, the shifting function of the infinitive, the oscillation of the leading particle ὥστε are enough, single or combined, to perplex the student who tries either the analytical or the historical method, or both. *Amer. Jour. Philol.*, VII. 163.

Consecution month, the space between one conjunction of the moon with the sun and another; a synodic month.—**Consecution of tenses.** Same as *sequence of tenses*. See *sequence*.—**Reciprocal consecution,** in *logic*, the relation of two facts either of which implies the other.

Consecutive combination. See *combination*.—**Consecutive intervals,** in *music*, the similar intervals that occur between two voices or parts that pass from one chord to another in parallel motion. Also called *parallel intervals*. Consecutive thirds and sixths are agreeable; consecutive fourths, disagreeable; while consecutive perfect fifths or octaves (or unisons) are usually forbidden. Consecutive fifths and octaves (or unisons) are covered or hidden when the fifth or octave is reached by similar but not parallel motion; such progressions are rarely objectionable, except when occurring between the outer, most conspicuous voices, and not then if one of

the voices moves only a semitone.—**Consecutive particle,** in *logic,* a conjunction implying logical consecution: as, *then, so, therefore,* etc.—**Consecutive points** of a curve, coincident points of tangency of coincident tangents. Thus, the tangent to a curve at a node is said to meet the curve in three coincident points, of which two are not only coincident, but (what is more than coincident) consecutive. This means that a right line cutting the curve in three points may by a continuous motion be brought into coincidence with the tangent at the node, the three points in this motion running up into one, and the motion of two of them being, at the limit, entirely along the tangent.—**Consecutive poles,** in *magnetism.* See *magnet.*—**Consecutive symptoms,** in *pathol.,* symptoms that appear on the cessation or during the decline of a disease, but which have no direct or evident connection with the primary ailment.

Consensual contract, in *civil law,* a contract which, though made without the formalities of delivery, writing, or entry in account, was enforcible on the ground that in cases of sale, partnership, agency, and hiring proof of the consent of the parties was enough.

> The term *Consensual* merely indicates that the Obligation is here annexed at once to the Consensus. The Consensus, or mutual assent of the parties, is the final and crowning ingredient in the Convention, and it is the special characteristic of agreements falling under one of the four heads of Sale, Partnership, Agency, and Hiring, that, as soon as the assent of the parties has supplied this ingredient, there is at once a *Contract.* The Consensus draws with it the Obligation, performing, in transactions of the sort specified, the exact functions which are discharged, in other contracts, by the Res or Thing, by the Verba stipulationis, and by the Literæ or written entry in a ledger. *Consensual* is therefore a term which does not involve the slightest anomaly, but is exactly analogous to Real, Verbal, and Literal. *Maine,* Ancient Law, p. 322.

Consensual motions, in *physiol.,* two or more simultaneous motions, of which the secondary or more remote are independent of the will, such as the contraction of the iris when the eye is opened to admit the light.

consols (kon'solz or kon-solz'), *n. pl.* [Contr. of *consolidated annuities*.] Government securities of Great Britain, including a large part of the public debt, the full name of which is "the three per cent. consolidated annuities." The consols originated in the consolidation of a great variety of public securities, chiefly in the form of annuities, into a single stock and at a uniform rate of 3 per cent., under an act of Parliament of 1751, the name being retained for all securities of the same form since issued. The principal is payable only at the pleasure of the government. They are also called "consolidated threes," and other nearly related stocks of smaller amount are known as "reduced threes" and "new threes." The rate of interest was reduced in 1884 to 2¾ per cent., and on Dec. 1, 1901, to 2½ per cent.

The perfect consonances are the unison, the octave, the fifth, and the fourth; the imperfect are the major and minor thirds and the major and minor sixths. The effect of consonances is due to the simplicity of the ratio between the vibration-numbers of their constituent tones. Thus, the ratio of the unison is 1:1; of the octave, 2:1; of the fifth, 3:2; of the fourth, 4:3; of the major sixth, 5:3; of the major third, 5:4; of the minor third, 6:5; of the minor sixth, 8:5. Also called *concord*.

II. *n.* An alphabetic element other than a vowel; one of the closer, less resonant and continuable, of the sounds making up a spoken alphabet; an articulate utterance which is combined, to form a syllable, with another opener utterance called a vowel. Consonants are the closer, and vowels the opener, of the sounds that make up the alphabetic scale or system of a language. But there is no absolute line of distinction between the two classes; and the openest of the consonants may be and are used as vowels also. Thus, the same *l*-sound is consonant in *apply*, and vowel in *apple*; *n* is consonant in *burned*, but vowel in *burden*; and in some languages, as Sanskrit and Polish, *r* is much used as a vowel. On the other hand, *y* and *w* are hardly, if at all, distinguishable from *ee* and *oo*. Such consonants, as standing near the boundary between consonant and vowel, are often called *semi-vowels* (also *liquids*). According to their degree of closeness, consonants are divided into *mutes* (or *stops*, or *checks*, or *explosives*), as *b* and *p*, which involve a complete cutting off of the passage of the breath; *fricatives* (*spirants* and *sibilants*, etc.), as *th* and *dh* (TH), *f* and *v*, *s* and *z*, in which a rustling or friction of the breath through a nearly closed position of the organs is the conspicuous element; *nasals*, as *n*, *m*, and *ng*, accompanied with admission of the intonated breath to the nose and its resonance there; and *semi-vowel* or *liquid* sounds, as already illustrated. According to the organs used in producing them, they are divided into *labials*, made with the lips, as *p*, *b*, *f*, *v*, *m*; *dentals* or *linguals*, made with the tip of the tongue at or near the teeth, as *t*, *d*, *th*, *dh* (TH), *n*; *palatals* or *gutturals*, made with the back of the tongue, as *k*, *g*, *ng*; and some languages have various other classes. Then, according as they are made with simple breath, or with breath vocalized or made sonant in the larynx, they are divided into *surd* or *breathed*, as *p*, *t*, *f*, *s*, etc., and *sonant* or *voiced* or *vocal*, as *b*, *d*, *v*, *z*, etc. (sometimes wrongly distinguished as *hard* and *soft*, as *strong* and *weak*, as *sharp* and *flat*, and so on). See these various terms, and *syllable*.

'count of the stable,' master of the horse: L. *comes*, a follower, etc.; *stabuli*, gen. of *stabulum*, a stable: see *count*[2] and *stable*[2].] **1.** An officer of high rank in several of the medieval monarchies. The *Lord High Constable of England* was the seventh officer of the crown. He had the care of the common peace in deeds of arms and matters of war, being a judge of the court of chivalry, or court of honor. To this officer, and to the earl marshal, belonged the cognizance of contracts touching deeds of arms without the realm, and combats and blazonry within the realm. His power was so great, and was often used to such improper ends, that it was abridged by the 13th Richard II., and was afterward forfeited in the person of Edward Stafford, Duke of Buckingham, in the reign of Henry VIII. It has never been granted to any person since that time, except on a particular occasion. The office of *Lord High Constable of Scotland* is one of great antiquity and dignity. He had formerly the command of the king's armies while in the field, in the absence of the king. He was likewise judge of all crimes or offenses committed within four miles of the king's person, or within the same distance of the parliament or of the privy council, or of any general convention of the states of the kingdom. The office has been hereditary since 1314 in the family of Hay, earls of Erroll, and is expressly reserved in the treaty of union. The *Constable of France* was the first officer of the kings of France, and ultimately became commander-in-chief of the army and the highest judge in all questions of chivalry and honor. This office was suppressed in 1627. Napoleon reëstablished it during a few years, in favor of his brother Louis Bonaparte. The *constable of a castle* was the keeper or governor of a castle belonging to the king or a great noble. This office was often hereditary; thus, there were constables or hereditary keepers of the Tower, of Normandy, and of the castles of Windsor, Dover, etc.

The *constabill* of gude Dundè,
The vanguard led before them all.
Battle of Harlaw (Child's Ballads, VII. 185).

2. An officer of the peace, who performs a number of minor administrative duties; in England, a policeman. There the head of the county constabulary is the *chief constable*, appointed by the justices of the peace and county councils; his subordinates include a *deputy constable* and constables. *High constables* or *constables of hundreds* and *petty constables* or *tithingmen*, offices of great antiquity, dependent chiefly on fees, were abolished in 1869. All able-bodied men had to serve in turn as *petty constables*, and were subordinate to the *high constables*. *Parish constable*, one appointed by the vestry (abolished in 1872, save as needed in special localities). In the United States the constable is an official of a town or village, elected with the other local officers, or, as a special constable, acting under a temporary appointment. The constable was formerly of much more consequence both in England and the colonies, being the chief executive officer of the parish or town.

The *constable* was formerly the chief man in the parish, for then the parish was responsible for all robberies committed within its limits if the thieves were not apprehended. . . . But this state of things has long passed away; . . . and although *constables* are in some few instances still appointed, their duties are almost entirely performed by the county police.
A. Fonblanque, Jr., How we are Governed, p. 69.

See above, 2.—**Parish constable**, in England, a petty constable exercising his functions within a given parish.—**Special constable**, a person sworn to aid the constituted authorities, military or civil, in maintaining the public peace on occasions of exigency, as to quell a riot.—**To outrun the constable.** (*a*) To escape from the subject in dispute when one's arguments are exhausted. *S. Butler.* (*b*) To live beyond one's means. In this latter sense also *overrun the constable*. [Colloq.]

"Harkee, my girl, how far have you *overrun the constable?*" I told him that the debt amounted to eleven pounds, besides the expence of the writ.
Smollett, Roderick Random, xxiii.

Poor man! at th' election he threw, t'other day,
All his victuals, and liquor, and money away;
And some people think with such haste he began,
That soon he *the constable* greatly *outran*.

Specifically—(*a*) In *math.*, a quantity which is assumed to be invariable throughout a given discussion; in the differential calculus, a quantity whose value remains fixed while others vary continuously. Although the constants do not vary by the variation of those quantities that are at first considered as variables, some or all of them may be conceived to vary in a second kind of change, called the *variation of constants*. A quantity which upon one supposition would remain constant becomes variable by the introduction of another supposition. Thus, taking into account the earth's attraction only, the longitude of the moon's node is constant, but by the attraction of the sun and planets its place is slowly changed. In this case one of the constants is said to *vary*. In algebra the unknown quantities of an indeterminate equation are considered as *variables*, the known quantities and coefficients as *constants*. (*b*) In *physics*, a numerical quantity, fixed under uniform conditions, expressing the value of one of the physical properties of a certain substance. Thus, the *physical constants* of ice are the values of its specific gravity, melting-point, coefficient of expansion, index of refraction, electrical conductivity, etc. Similarly, in the case of a physical instrument a *constant* is a fixed value depending upon its dimensions, etc. Thus, the constant of a tangent galvanometer is the radius of its coil divided by the number of coils into 6.28318 +.

The strength of a current may be determined in "absolute" units if the *constants* of the instrument are known.
S. P. Thompson, Elect. and Mag., p. 166.

The gravitation constant is about 0.0000000658 of a c. g. s. unit.—**Indeterminate constant**, a constant the value of which is unsettled, and which therefore differs from a variable only in not being regarded under that aspect.

It was natural that the Venetians, whose State lay upon the borders of the Greek Empire, and whose greatest commerce was with the Orient, should be influenced by the *Constantinopolitan* civilization.
Howells, Venetian Life, xxi.

Constantinopolitan Council, one of the several church councils held at Constantinople. The most famous of these are three general or ecumenical councils, namely: the second general council, under Theodosius, in A. D. 381, which condemned Macedonianism, authorized the creed commonly called the Nicene, and gave honorary precedence to the see of Constantinople next after that of Rome; the fifth general council, under Justinian, in 553, which condemned the Nestorian writings known as "the Three Chapters," and the Origenists; and the sixth general council, under Constantine Pogonatus, 680, against Monothelitism, celebrated for its condemnation of Pope Honorius. The Roman Catholics also regard as ecumenical the eighth council, held in 869. The council commonly known as the Quinisext, because regarded as complementary to the fifth and sixth councils, was held at Constantinople under Justinian II. in 691, in the trullus or domed banqueting-hall of the palace, from which it was also called the Trullan Council. Its canons are received by the Greek Church, and were confirmed by the second Nicene Council. A council held at Constantinople under Constantine Copronymus in 754, favoring the Iconoclasts, claimed to be ecumenical, but its decrees were reversed by the second Nicene Council in 787. See *council*, 7.—**Constantinopolitan creed.** See *Nicene*.—**Constantinopolitan liturgy.** See *liturgy*.

See *asterism*. Forty-eight constellations are mentioned in the ancient catalogue of Ptolemy, the majority of which appear to date from 2100 B. C. or earlier. They are distributed as follows: (1) North of the zodiac: Ursa Minor (the Little Bear, said to be formed by Thales, probably from the Dragon's wing), Ursa Major (the Great Bear, the Wain, or the Dipper), Draco (the Dragon), Cepheus, Bootes (the

Bear-keeper or Plowman), Corona Borealis (the Northern Crown), Hercules (in the original the Man Kneeling), Lyra (the Harp), Cygnus (the Swan, in the original the Bird), Cassiopeia (the Lady in the Chair), Perseus, Auriga (the Charioteer or Wagoner), Ophiuchus or Serpentarius (the Serpent-bearer), Serpens (the Serpent), Sagitta (the Arrow), Aquila et Antinoüs (the Eagle and Antinoüs), Delphinus (the Dolphin), Equulus or Equuleus (the Colt or the Horse's Head), Pegasus or Equus (the Horse), Andromeda, Triangulum Boreale (the Northern Triangle). (2) In the zodiac: Aries (the Ram), Taurus (the Bull), Gemini (the Twins), Cancer (the Crab), Leo (the Lion), Virgo (the Virgin), Libra (the Balance), Scorpius or Scorpio (the Scorpion), Sagittarius (the Archer), Capricornus (Capricorn, or the Goat), Aquarius (the Water-bearer), Pisces (the Fishes). (3) South of the zodiac: Cetus (the Whale), Orion, Eridanus or Fluvius (the River Po or the River), Lepus (the Hare), Canis Major (the Great Dog), Canis Minor (the Little Dog), Argo Navis (the Ship Argo), Hydra, Crater (the Cup), Corvus (the Crow or Raven), Centaurus (the Centaur), Lupus (the Wolf), Ara (the Altar), Corona Australis (the Southern Crown), Piscis Australis (the Southern Fish). Coma Berenices (the Hair of Berenice) is an ancient asterism, which was not reckoned as a constellation by Ptolemy. Antinoüs, mentioned by Ptolemy as part of the constellation Aquila, is said to have been made a separate constellation by Firmicus in the fourth century. Crux (the Crozier or Southern Cross) appears to be mentioned by Dante. The navigators of the sixteenth century added a number of southern constellations. Twelve of these appear in the important star-atlas of Bayer (A. D. 1603), namely: Apus (the Bird of Paradise), Chameleon, Dorado (the Goldfish; or Xiphias, the Swordfish), Grus (the Crane), Hydrus (the Watersnake), Indus (the Indian Man), Musca or Apis (the Fly or the Bee), Pavo (the Peacock), Phœnix, Triangulum Australe (the Southern Triangle), the Toucan (also called Anser Americanus), and Volans (the Flying-fish). Columba (the Dove of Noah) was made by Petrus Plancius early in the sixteenth century. Bartschius in 1624 added several constellations, of which Camelopardalis (the Camelopard) and Monoceros (the Unicorn) are retained by modern astronomers. Hevelius in 1690 added Canes Venatici (the Greyhounds), Lacerta (the Lizard), Leo Minor (the Small Lion), Lynx (the Lynx), Scutum Sobiescii (the Shield of Sobieski), Sextans (the Sextant), and Vulpecula et Anser (the Fox and the Goose). Finally, Lacaille in 1752 added Antlia Pneumatica (the Air-pump), Cælum (the Graver), Circinus (the Compass), Fornax (the Furnace), Horologium (the Clock), Mons Mensæ (the Table-mountain), Microscopium (the Microscope), Norma (the Quadrant), Octans (the Octant), Equus Pictorius (the Painter's Easel), Reticulum (the Net), Sculptor, and Telescopium (the Telescope). The ancient constellation Argo was broken up by Lacaille into the Stern, the Keel, the Sail, and the Mast. There are, thus, eighty-five constellations now recognized. The names of the constellations are mostly derived from Greek and Roman mythology. The practice of designating by the letters of the Greek alphabet (α, β, γ, etc.) the stars which compose each constellation, in the order of their brilliancy, originated with Bayer.

2. Figuratively, any assemblage of persons or things of a brilliant, distinguished, or exalted character: as, a *constellation* of wits or beauties, or of great authors.

5. Any system of fundamental principles of action: as, the New Testament is the moral *constitution* of modern society.—**Apostolic Constitutions.** See *apostolic.*—**British Constitution,** a collective name for the principles of public policy on which the government of the United Kingdom of Great Britain and Ireland is based. It is not formulated in any particular document or set of documents, but is the gradual development of the political intelligence of the English people, as embodied in concessions forced from unwilling sovereigns, in the results of various revolutions, in numerous fundamental enactments of Parliament, and in the established principles of the common law. The character of the government has become increasingly democratic, and the power of the sovereign, great in the time of the Tudors, Stuarts, and earlier, is now much abridged. The controlling force in the movement has been the gradually acquired supremacy of Parliament (now residing almost entirely in the House of Commons) over the executive powers of government, so that the principal function of the sovereign is now that of simple confirmation. The chief muniments of the British Constitution, as a growth of liberal representative government, are the Magna Charta and its successive extensions, the Habeas Corpus Act, and the Bill of Rights, the principles of which have been incorporated in all the written constitutions of the English-speaking race. (See these terms.)—**Constitution coin,** a German coin struck according to the Leipsic rate of coinage, 8 rix-dollars weighing a Cologne mark of silver, 14 loths 4 grains fine, and 13½ florins weighing one mark, 12 loths fine. This rate, adopted by some states in 1690, was established throughout the empire from 1738 to 1763.—**Constitution of the United States,** or **Federal Constitution,** the fundamental or organic law of the United States. It was framed by the Constitutional Convention which met in Philadelphia May 25th, 1787, and adjourned September 17th, 1787, and it went into effect March 4th, 1789 (although Washington, the first president under it, was not inaugurated till April 30th), having been ratified by eleven of the thirteen States, the others, North Carolina and Rhode Island, ratifying it November 21st, 1789, and May 29th, 1790, respectively. It is a document comprised in seven original articles and seventeen amendatory articles (amendments). Of the original articles, the first deals with the legislative body, prescribing the method of election to the House of Representatives and the Senate, the qualifications of members, the methods in which bills shall be passed, and those subjects on which Congress shall be qualified to act; the second relates to the executive department, prescribing the method of election and the qualifications and duties of the President; the third relates to the judicial department, providing for the supreme court and such inferior courts as Congress may think necessary; the fourth deals with the relations between the general government and the separate States, and provides for the admission of new States; the fifth relates to the power and method of amendment to the Constitution; the sixth, to the national supremacy; and the seventh, to the establishment of the government upon the ratification of the Constitution by nine of the States. The amendments, according to one of the methods provided, were proposed by Congress and ratified by the States. The first twelve were submitted under acts passed in 1789–90, 1793, and 1803; the next three, after the civil war, under acts of 1865, 1868, and 1870; and the last two were ratified in 1913. The most important of them are the twelfth, which changed the method of election of President and Vice-president; the thirteenth, which abolished slavery; the fourteenth, which disqualifies any one who has been engaged in rebellion against the government from holding office unless his disqualification be removed by Congress, and prevents the assumption and payment of any debt incurred in aid of rebellion; and the fifteenth, which prohibits the denial to any one of the right to vote because of race, color, or previous condition of servitude. The sixteenth gave Congress power to collect a direct income tax; the seventeenth provided for election of United States senators by popular vote.—**Constitutions of Clarendon,** in *Eng. hist.*, certain propositions defining the limits of ecclesiastical and civil jurisdiction, drawn up at the Council of Clarendon, near Salisbury, held by Henry II. in 1164. Though purporting to declare usages prevailing in the reign of Henry I., they were never accepted by the clergy, and were renounced in 1172.—**Decree of constitution,** in *Scots law*, any decree by which the extent of a debt or an obligation is ascertained: but the term is generally applied to those decrees which are requisite to found a title in the person of the creditor in the event of the death of either the debtor or the original creditor.

2. Beneficial to, or designed to benefit, the physical constitution: as, a *constitutional* walk. —**3.** Forming a part of, authorized by, or consistent with the constitution or fundamental organic law of a nation or state. In English law the question whether an act is constitutional turns on its consistency with the spirit and usages of the national polity, and an innovation departing from that standard is not necessarily void. In the United States the question turns on consistency or conformity with the written constitution, and an act in contravention of that is void.

The term *consubstantiation* was employed in the doctrinal controversies of the Reformation by non-Lutheran writers, to designate the Lutheran view of the Saviour's presence in the Holy Supper. The Lutheran Church, however, has never used or accepted this term to express her view, but has always and repeatedly rejected it, and the meaning it conveys, in her official declarations.

They [the Lutherans] believe that the real body and blood of our Lord is united in a mysterious manner, through the consecration, with the bread and wine, and are received with and under them in the sacrament of the Lord's supper. This is called *consubstantiation*. *Hooker.*

They, therefore, err, who say that we believe in impanation, or that Christ is in the bread and wine. Nor are those correct who charge us with believing subpanation, that Christ is under the form of bread and wine. And equally groundless is the charge of *consubstantiation*, or the belief that the body and blood of Christ are changed into one substance with the bread and wine. . . . Actual contact; a touching; the state of being in contact, or within touching distance; hence, proximity of situation or place; contiguousness; adjacency.

Regard is justly had to *contiguity*, or adjacency, in private lands and possessions. *Bacon*, Fable of Perseus.

In a community of so great an extent as ours, *contiguity* becomes one of the strongest elements in forming party combinations, and distance one of the strongest elements in repelling them. *Calhoun*, Works, I. 233.

3. In *psychol.*, the coexistence or immediate sequence of two or more impressions or experiences. The *law of contiguity* is that law of mental association according to which an idea which has been accompanied or followed by another in the past is likely to be accompanied or followed by that other on any occasion of reproduction, this tendency being stronger the oftener and the closer the contiguity of the ideas has been. Contiguity is the most characteristic of the principles of association. It was stated by Aristotle, and was revived by David Hume, who used the word *contiguity* to translate Aristotle's term τὸ συνεγγυς. Thomas Brown reduced all association to prior coexistence or immediate proximity; and he is followed by perhaps the majority of modern psychologists.

The qualities from which this association arises, and by which the mind is after this manner convey'd from one idea to another, are three, viz.: Resemblance, *Contiguity* in time or place, and Cause and Effect. *Hume*, Treatise of Human Nature (1739), i. § 4.

The *contiguity* in time and place must mean that of the sensations; and so far it is affirmed that the order of the ideas follows that of the sensations. *Contiguity* of two sensations in time means the successive order. *Contiguity* of two sensations in place means the synchronous order. *James Mill*, Analysis of Human Mind, iii.

3. In *phys. geog.*, one of the largest landmasses of the globe. From the most general point of view there are two continental masses, the eastern and the western, the old world and the new world. In breaking these up into lesser divisions, Europe and Asia together naturally constitute one mass, conveniently designated as Eurasia, though each is sometimes reckoned a separate continent. Africa, formerly attached to Asia very slightly by the isthmus of Suez, and now artificially severed from it by the Suez canal, forms another continental mass. Australia is regarded by many as a third continental subdivision of the eastern land-mass (or a fourth, reckoning Europe and Asia separately). North and South America form the two great natural subdivisions (also separately called continents) of the western continent, and are hardly more united than were Africa and Asia before the cutting of the Suez canal.

4. [*cap.*] In a special sense, in English literature, the mainland of Europe, as distinguished from the British islands: as, to travel on the *Continent.*

Such a climate is subject to great fluctuations of temperature, both diurnal and seasonal. An insular climate, on the other hand, is much more equable. This difference is most marked in the case of a small island remote from all other land, as contrasted with the central portions of a continental mass like Asia. At a great distance from the sea, and especially if the land-area is very large, the summer is abnormally hot and the winter proportionally cold, while the difference between the temperatures of night and day is also very marked. The interiors of the continents have in general a smaller rainfall than their edges. — **Continental glacier,** a sheet of ice which covers a large part of a continent such as that which now covers Greenland; an ice-sheet. — **Continental pronunciation,** or **system of pronunciation,** of Latin and Greek. See *pronunciation.* — **Continental system,** in *modern hist.*, the plan of the emperor Napoleon for excluding the merchandise of England from all parts of the continent of Europe. tion. *Continuation* is used properly of extension in space, *continuance* of time, *continuity* of substance, and *continuousness* of freedom from interruption in space or time. Thus we speak of the *continuation* of a line of railroad (that is, the construction of it beyond a certain point, or the part thus constructed); the *continuance* of suffering; the *continuity* of fibers (that is, their cohesion or preservation of relations). A ferry would break the *continuousness* of a line of railroad. See *continuous*.

where *a*, *b*, *c*, *d*, *e*, etc., and α, β, γ, δ, etc., are usually taken to represent whole numbers. A *proper continued fraction* is one in which $a = \beta = \gamma = \delta = \text{etc.} = 1$. An *improper continued fraction* is one in which these quantities are all −1. The quantities *a*, *b*, *c*, *d*, *e*, etc., are termed the *quotients* or *incomplete quotients*. A *terminating continued fraction* is one having a finite number of quotients. Such quantities are also said to be in *continued proportion*, and a series of continued proportionals is otherwise called a *geometrical progression.*—**Continued voyage,** or **continuous voyage,** a voyage prosecuted to completion. In the law of prizes, a voyage of a vessel carrying contraband of war, or carrying goods intended for a blockaded port, although in fact ended by stopping short of the unlawful destination and making a transhipment in order to evade the law, is treated by some courts as if continued, thus bringing upon the vessel and cargo the same liability as if it had continued the voyage and effected the unlawful purpose.

★**continuity** (kon-ti-nū′i-ti), *n.* [< F. *continuité* = Sp. *continuidad* = Pg. *continuidade* = It. *continuità*, *continuitate*, < L. *continuita(t-)s*, < *continuus*, continuous: see *continuous.*] **1.** Uninterrupted connection of parts in space or time; uninterruptedness.

Fire will live in it [vapor of the grotto del Cani] no longer than in water, because it wraps itself . . . about the flame, and by its *continuity* hinders . . air and nitre from coming to its succour. *Addison*, Italy.

2. In *math.* and *philos.*, a connection of points (or other elements) as intimate as that of the instants or points of an interval of time: thus, the *continuity* of space consists in this, that a point can move from any one position to any other so that at each different instant it shall have a definite and different position in space. This is not, however, a proper definition of *continuity*, but only an exemplification drawn from time. The old definitions—the fact that adjacent parts have their limits in common (Aristotle), infinite divisibility (Kant), the fact that between any two points there is a third (which is true of the system of rational numbers)—are inadequate. The less unsatisfactory definition is that of G. Cantor, that continuity is the *perfect concatenation* of a system of points—words which must be understood in special senses. Cantor calls a system of points *concatenated* when any two of them being given, and also any finite distance, however small, it is always possible to find a finite number of other points of the system through which by successive steps, each less than the given distance, it would be possible to proceed from one of the given points to the other. He terms a system of points *perfect* when, whatever point not belonging to the system be given, it is possible to find a finite distance so small that there are not an infinite number of points of the system within that distance of the given point. As examples of a concatenated system not perfect, Cantor gives the rational and also the irrational numbers in any interval. As an example of a perfect system not concatenated, he gives all the numbers whose expression in decimals, however far carried out, would contain no figures except 0 and 9.

The simplest of the Concrete Sciences, Astronomy and Geology, yield the idea of *continuity* with great distinctness. I do not mean *continuity* of existence merely; I mean *continuity* of causation: the unceasing production of effect—the never-ending work of every force. *H. Spencer*, Study of Sociol., p. 322.

The motion of a material particle which has continuous existence in time and space is the type and exemplar of every form of *continuity.* *Clerk Maxwell*, Matter and Motion, Art. xxv.

3. In *zoöl.* and *anat.*, that part of a thing which lies between the two ends, as the shaft of a long bone, or its diaphysis, as distinguished from its condyles or epiphyses, or the middle portion of the bill of a bird, as distinguished from the base and apex. [Chiefly an anatomical term, and especially a surgical one: as, the fracture of a bone in its *continuity.*]—**Continuity of forms,** in the *Kantian philos.*, the doctrine that if A and B are two concepts such that A includes the whole content of B and more, there will always be a third concept C, such that A includes the whole content of C and more, while C includes the whole content of B and more.—**Equation of continuity,** in *hydrodynamics*, the equation which expresses that any change in the quantity of fluid within any closed surface is, in the absence of sources or sinks within the surface, due to the flow of fluid through the surface. In its differential form the equation is

$$\frac{d\rho}{dt}+\frac{d\rho u}{dx}+\frac{d\rho v}{dy}+\frac{d\rho w}{dz}=0,$$

where *t* is the time, ρ the density, *x*, *y*, *z* the rectangular coördinates, and *u*, *v*, *w* the corresponding components of the velocity.—**Law of continuity,** the doctrine that continuous changes in conditions will be accompanied by continuous changes in the results. This law was first set forth by Leibnitz in 1687, and employed to show that the properties of the parabola may be deduced from those of the ellipse, the laws of rest from those of motion, etc. Later he declared it applicable to such questions as whether there is an uninterrupted series of species from the highest to the lowest. The doctrine has often been understood as implying that there are no abrupt variations in nature.

From the knowledge of the complete state at any instant of a thing whose motion obeys the *law of continuity*, we can calculate where it was at any past time, and where it will be at any future time. *W. K. Clifford*, Lectures, I. 122.

Solution of continuity, rupture; separation of parts intimately connected. = **Syn.** *Continuance*, etc. See *continuation.*

Thus, a stem which has no joints is said to be *continuous*.—**Continuous bearings**, chains of timber laid under the rails of a railroad for their support, in place of stone or wooden sleepers fixed at certain intervals. The chains of timber, or longitudinal sleepers, are secured to cross-transoms fixed to piles.—**Continuous brake, girder, impost,** etc. See the nouns.—**Continuous function**, a function whose differential coefficient is nowhere infinite, so that an infinitesimal increment of the variable produces an infinitesimal increment in the value of the function.—**Continuous-service certificate**, a certificate issued to enlisted men in the United States navy with good records who reënlist within four months after the expiration of their term of service.—**Continuous voyage.** See *continued voyage*, under *continued*. = **Syn.** *Continuous, Incessant, Continual*, etc. See *incessant*.

II. *n.* A coin or medal having such a circumference: a term applied by numismatists to certain Roman copper pieces, which are characterized by having on each side a circular furrow. They bear on one face a head (of Nero, Trajan, etc.), and on the other a subject generally relating to the games in the circus or amphitheater. They were doubtless issued at Rome in the fourth and fifth centuries A. D., but their ancient appellation is unknown, and the purpose for which they were employed is uncertain. (*b*) In *fort.*, the horizontal outline of works of defense. When the conformation of the ground or works is described by contours or horizontal sections, these sections are taken at some fixed vertical interval from each other suited to the scale of the drawing or the subject in hand; and the distances of the surface, at each interval, above or below some assumed plane of comparison, are given in figures at the most convenient places on the plan. (*c*) In *surv.*, a curve of equal elevation on a map; a contour-line. (*d*) In *math.*, a closed curve considered as inclosing an area.—**Area of a contour.** See *area*. = **Syn.** *Profile*, etc. See *outline*.

contour-hair (kon-tör'hãr), *n.* One of the hairs of the general superficial pelage of a quadruped, which to some extent determines the contour of the animal: distinguished from the hidden under-fur. contour-line (kon-tör'līn), *n.* In *surv.*, a line joining points of equal elevation on a surface; a line or level carried along the surface of a country or district at a uniform height above the sea-level. When laid down or plotted on a map or plan, such lines show the elevations and depressions of the surface of the ground, the degree of accuracy depending on the number of lines or levels taken. In the maps of the Coast and Geodetic Survey of the United States the contour-lines are generally given for every 20 feet of elevation. It is essential to the completeness of a contour-line that it should be carried on till it returns to the point whence it started, thus describing a closed curve. The littoral cordon or outline of the sea forms a natural contour-line. The system of representing the form of the earth's surface by means of horizontal lines at equal vertical distances was probably invented by Philippe Buache in 1744.

Contour-lines, eighty feet apart vertically, were run; and intermediate forty-foot contours were interpolated by means of slope-measurements in the steeper parts, and by running curves in the more level portions.
Science, III. 365.

Contour-line map, a map in which the elevations are indicated by contour-lines, which may be drawn at any distance apart, according to the scale adopted and the accuracy with which the surveys have been made. Where the slope is steep the lines are more crowded together, and vice versa. This is, on the whole, the most advantageous method of representing topography where the scale adopted is large.

Articles by general consent deemed to be *contraband* are such as appertain immediately to the uses of war.
Woolsey, Introd. to Inter. Law, § 179.

Contraband goods, such goods as are prohibited to be imported or exported by the laws of a particular kingdom or state, or by the law of nations, or by special treaties. In time of war, arms and munitions of war, and such other articles as may directly aid belligerent operations (called *contraband of war*), are not permitted by one belligerent to be transported by neutrals to the other, but are under the law of nations held to be contraband and liable to capture and condemnation.

Contraband of war perhaps denoted at first that which a belligerent publicly prohibited the exportation of into his enemy's country, and now those kinds of goods which by the law of nations a neutral cannot send into either of the countries at war without wrong to the other, or which by conventional law the states making a treaty agree to put under this rubric.
Woolsey, Introd. to Inter. Law, § 178.

What I have said of the proportion of free colored persons to the whites in the District [of Columbia] is from the census of 1860, having no reference to persons called *contrabands*. *Lincoln*, in Raymond, p. 326.

Occasional contraband, goods treated as contraband by a belligerent, upon the pretext or justification that, though not ordinarily contraband, they are in effect such by reason of the peculiar circumstances of the occasion; doubtful articles put into the list of contraband by a belligerent merely because they are not the product of the exporting country, or because they are intended for a naval or military port, or for similar reasons.

The doctrine of *occasional contraband*, or contraband according to circumstances, is not sufficiently established to be regarded as a part of the law of nations.
Woolsey, Introd. to Inter. Law, § 180.

5. Specifically, in *law*, an interchange of legal rights by agreement. (*a*) In the most general sense, any agreement or obligation whereby one party becomes bound to another, whether by record or judgment, or by assent, or even impliedly, to do or to omit to do an act. In this sense it is used in contradistinction to obligations arising out of torts or wrongs. (*b*) The legal obligation resulting from the drawing together of minds until they meet in an agreement for the doing or the not doing of an act. In its narrowest use in this sense it implies an agreement where both parties become bound. Contracts of this sort are sometimes called *bilateral*, to distinguish them from *unilateral* contracts, which bind but one party. (*c*) An agreement in which a party undertakes to do or not to do an act. In this sense it includes *unilateral contracts*, such as promissory notes. (*d*) In the most strict sense, an agreement enforcible by law; an agreement upon sufficient consideration, and in such form, and made under such circumstances, that a breach of it is a good cause of action. In this sense it includes the idea of validity, as distinguished from those contracts which lack some element necessary to constitute a legal obligation. (*e*) In *civil law*, as defined by modern authors, the union of two or more persons resulting in an accordant declaration of the will, with the object of creating a future obligation between them. In the Pandects the generic word was *conventio*, and the word *contractus* was used for those particular conventions which were accompanied by such formalities as to fall within one of the classes recognized by the law as binding; the other conventions, the recognition of which was of later growth, and which were of imperfect effect, were called *pacta*.—**Accessory contract, aleatory contract, bare contract, commutative contract**, etc. See the adjectives.—**Contract of record**, a contract made and entered of record before a judicial tribunal, as a judgment, recognizance, etc.—**Executed contract**, a contract in respect of which the thing agreed has been done; a contract by or under which the possession of and right to the chose or thing are transferred together, as a deed conveying land.—**Executory contract**, a contract in respect of which the thing agreed remains yet to be done, as a contract to convey land at a future day. A mutual contract (which see) may be *executed* as to one party, and remain *executory* as to the other.—**Express contract**, a contract in which the agreement is made in express words or by writing.—**Gambling contract**, a contract to pay at a certain future time an amount equal to any rise in the market price of any article of commerce, in consideration that the other party will pay the amount equal to any fall. *Bisbee and Simonds*.—**Implied contract**, a contract which the law imputes or raises by construction, by reason of some value or service rendered, and because common justice requires the party to be treated as if he had agreed: as, where one person receives the money of another, a *contract* to pay it over may be *implied*.—**Indeterminate contract**, a contract the terms of which cannot be fixed by all the parties acting for their true interests, because the circumstances are such that no agreement (nor acquiescence in a non-agreement) can be reached until other motives act.—**Innominate contracts.** See *nominate contracts*, below.—**Joint contract**, a contract in which the contractors are jointly bound to perform the promise or obligation therein contained, or entitled to receive the benefit of such promise or obligation. *Bouvier*.—**Literal contract**, in *Rom. law*, an agreement the validity of which was recognized by the tribunals provided the agreement was entered in the account-book of one, or it may have been of both, of the parties.—**Maritime contract.** See *maritime*.—**Marriage contract.** See *marriage*.—**Mutual contract**, a contract in which each party assumes his obligation in consideration of the obligation assumed by the other. *Goudsmit*.—**Nominate contracts**, in *Scots law*, are loan, commodate, deposit, pledge, sale, permutation, location, society, and mandate. (*b*) A written contract specifying in detail what is to be done, as a building-contract with specifications.—**To count on contract.** See *count*[1].—**Verbal contract,** a contract made by word of mouth, in contradistinction to one embodied in writing. (See *expansion* and *heat.*) Contraction also takes place when a gas is condensed to a liquid, and in most cases when a liquid is changed to a solid; there are, however, some exceptions, as water, which expands on solidifying.

Specifically—**3.** A shortening of a word in pronunciation or in writing: as, can't is a *contraction* of cannot. In writing, contraction takes place, as in pronunciation, primarily by the omission of intermediate letters; but also by writing in a smaller character the last letter above the word contracted, by running two or more letters into one character, by using symbols representing syllables or words, and by the use of initial letters: as, *reed.* for *received; q^m* for *quam; &* for *et.* Specifically, in *Gr. gram.,* the union of the concurrent vowels of two syllables into one long vowel or diphthong—that is, of ο+ω into ω, of ε+ε into ει, etc. See *abbreviation,* 2.

In the dactylic hexameter, for example, the fifth foot must ordinarily be a dactyl, not a spondee. The converse of *contraction* is *resolution.*

It usually affects the little finger first, is more frequent in males than in females, and seems to be favored by the gouty diathesis.—**Hour-glass contraction,** an irregular, local, transverse contraction of the uterus, at the internal os or above, occurring after the delivery of the child, and delaying the delivery of the placenta.=**Syn. 3.** *Abbreviation, Contraction.* See *abbreviation.*

Contradiction in terms, a self-contradictory phrase, as "a square circle."—**Principle of contradiction**, the principle that nothing can be both true and false in the same sense and in the same respects. Modern formal logic demonstrates that this principle enters into a large part of our reasoning, but forms the hinge only of a few very simple inferences (not of direct syllogism). Formerly many logicians regarded the law of contradiction as the governing principle of all demonstrative reasoning. Accordingly, it is often referred to as such without regard to its exact signification. The law was enunciated by Aristotle, but its name was perhaps first given to it by Ramus.

The proposition that no subject can have a predicate which contradicts it is called the *principle of contradiction*. It is a general though negative criterion of all truth.

When a portion of a liquid or a gas is heated above the temperature of surrounding portions, it increases in volume, and, thus becoming specifically lighter, rises, while the cooler portions of the fluid rush in from the sides and descend from the upper parts of the vessel. *Convection currents* are thus produced, and the liquid or gas is soon heated throughout. This principle is used in heating a house by a hot-air furnace. The Gulf Stream is a grand *convection current*, carrying the heat of the equator toward the pole. (See *heat*.) Similarly, electricity may be transmitted by convection by the mo-

tion of the electrified body itself, as when the electricity of a conductor is discharged by a point, it being carried off by a stream of electrified air-particles.

The term *convection* is applied to those processes by which the diffusion of heat is rendered more rapid by the motion of the hot substance from one place to another, though the ultimate transfer of heat may still take place by conduction. *Clerk Maxwell*, Heat, p. 10.

Conventionalism, indeed, is the modern name for that which stands here for the opposite of religion; and we can judge from this in what way religion itself was conceived, for the opposite of *conventionalism* is freshness of feeling, enthusiasm. *J. R. Seeley*, Nat. Religion, p. 123.

2. That which is received or established by convention or agreement; a conventional phrase, form, ceremony, etc.; something depending on conventional rules and precepts.

The Franciscans . . . had so far swerved from the obligations of their institute, which interdicted the possession of property of any description, that they owned large estates. . . . Those who indulged in this latitude were called *conventuals*, while the comparatively small num-

ber who put the strictest construction on the rule of their order were denominated observantes, or brethren of the observance. *Prescott*, Ferd. and Isa., ii. 5.

★**converge** (kon-vėrj'), *v.*; pret. and pp. *converged*, ppr. *converging*. [= F. *converger* = Sp. In *math.*: (*a*) The gradual and indefinite approximation of the sum of an infinite series toward a finite value. (*b*) The scalar part of the result of performing upon any vector function the operation

$$i\frac{d}{dx} + j\frac{d}{dy} + k\frac{d}{dz}.$$

It is so called because, if the vector function be considered as representing the velocity and direction of a flowing fluid, the surface integral of this function over a closed surface, or the flow inward through that surface, is equal to the volume integral of the convergence within the surface. See *curl*.—**Circle of convergence**, a circle so drawn in the plane whose points represent all imaginary values of the variable that all the points within it represent values for which a given series is convergent, and all points without it represent points for which the series is divergent. But of points on the circumference of the circle, some are generally of one class and some of the other.—**Magnetic points of convergence.** See *magnetic*.

★**convergent** (kon-vėr'jent), *a.* and *n.* [< F. *convergent* = Sp. Pg. Thus, the *convergents* to the ratio of the circumference of a circle to its diameter are, $\frac{3}{1}$, $\frac{22}{7}$, $\frac{333}{106}$, $\frac{355}{113}$, etc., these being approximations to the continued fraction representing this ratio. See *continued fraction*, under *continued*.

Thus,

$$1 + x + \frac{x^2}{1.2} + \frac{x^3}{1.2.3} + \frac{x^4}{1.2.3.4} + \frac{x^5}{1.2.3.4.5}$$

is a converging series for all values of x. But

$$x + \tfrac{1}{2}x^2 + \tfrac{1}{3}x^3 + \tfrac{1}{4}x^4 + \tfrac{1}{5}x^5, \text{ etc.},$$

is only converging for a value of x whose modulus is less than unity. Also called *convergent series*.

II. *n.* **1.** A part answering or corresponding to another, but differing from it in nature and required to make it complete; a complement; a counterpart: as, the hollows in a mold in which a medal has been cast are the *converse* of the parts of the medal in relief. [*Converse* is often used incorrectly in the sense of *reverse*—that is, the opposite, the contrary.

2. In *logic:* (*a*) Either of the pair of relations which subsist between two objects, with reference to each other: thus, the relation of child to parent is the *converse* of the relation of parent to child. (*b*) One of a pair of propositions having the same subject and predicate or antecedent and consequent, but in the reversed order. Thus, the proposition that every isosceles triangle has two of its angles equal is the *converse* of the proposition that every triangle having two angles equal is isosceles. See *conversion*, 2.

The given proposition is called the converted or *converse;* the other, into which it is converted, the converting. There is, however, much ambiguity, to say the least of it, in the terms commonly employed by logicians to designate the two propositions—that given, and the product of the logical elaboration. *Sir W. Hamilton*, Logic, xiv.

★**conversion** (kon-vèr'shon), *n.* [= F. *conversion* = Pr. *conversio* = Sp. *conversión* = Pg. *conversão* = It. *conversione*, < L. *conversio*(*n*-), < *convertere*, pp. *conversus*, convert: see *convert*, *v.*] **1.** In general, a turning or changing from one state or form to another; transmutation; transformation: sometimes implying total loss of identity: as, a *conversion* of water into ice, or of food into chyle or blood; the *conversion* of a thing from its original purpose to another; the *conversion* of land into money.

Specifically—**2.** In *logic*, that immediate inference which transforms a proposition into another whose subject-term is the predicate-term, and whose predicate-term the subject-term, of the former. *Simple, proper,* or *direct conversion* is that in which the quantity and quality of the propositions remain unchanged: as, No good man is unhappy; hence (by conversion), No unhappy man is good. *Conversion per accidens* (by accident) is that in which the quality of the first proposition is unchanged while its quantity is changed: as, All cockatrices are non-existent; hence (by conversion), Some non-existent things are cockatrices. *Conversion by contraposition* is where the quantity and quality are preserved, but the terms are infinitated: as, Some Chinamen are not honest; hence, Some non-honest persons are not non-Chinamen. The traditional rules of conversion are embodied in the verses,

Simpliciter *feci*, convertitur *eva* per acci,
Astro per contra, sicut conversio tota,

where the vowels of *feci, eva, astro*, show the kinds of propositions which can be converted in the three ways. (See *A*[1], 2 (*b*).) A *diminute conversion* is a conversion of a proposition such that the consequent asserts less than the antecedent: as, All lawyers are honest, and therefore some honest men are lawyers. An *improper* or *reductive conversion* is a conversion per accidens or by contraposition. A *universal conversion* is an inference by conversion whose conclusion is a universal proposition; a *partial conversion*, one whose conclusion is a particular proposition. [The Latin *conversio* was first used in this sense by Apuleius to translate Aristotle's ἀντιστροφή.]

Conversion of St. Paul, a festival of the Roman Catholic and of the Anglican Church, observed on the 25th of January, in commemoration of the conversion of St. Paul the Apostle, as related in the ninth chapter of Acts. =**Syn. 3.** *Conversion, Regeneration.* *Conversion* is generally employed to express the voluntary act of the individual in turning from sin to seek the pardon and grace of God, while *regeneration* is employed to express the divine act exerted by the Spirit of God on the soul of man. But this distinction is by no means always observed even in theological writings, and the two terms are often used synonymously.

In monasteries, a lay friar or brother admitted to the service of the house, without orders, and not allowed to sing in the choir.—**Clinical convert.** See *clinical*.—**Syn. 1.** *Neophyte, Convert, Proselyte, Pervert, Apostate, Renegade.* A *neophyte* is a convert who is still very new to the doctrine or duties of his religion; hence, figuratively, the word stands for a novice in any line; it does not at all suggest the abandonment of any other faith for the present one. A *convert* may or may not be from some other faith; the word expresses a radical change in convictions, feelings, purposes, and actions, and therefore suggests the sincerity of the subject; it is rarely used with a sinister meaning, but it may mean only acquiescence in a new faith proposed for nominal adherence: as, they were offered the choice of death or becoming *converts* to the faith of the conqueror. A *proselyte* is generally from some other faith or alliance, primarily in religion, but also in partizanship of any kind: *proselytism* does not necessarily imply conviction; the tendency is to use only *convert* in the good sense, and apply *proselyte* to one brought over by unworthy motives, and *proselytizer* to one who seeks recruits for his faith without being particular as to their being *converted* to it. *Pervert* as a noun is new, and confined chiefly to England; it is a paronomasia for *convert*, and a controversial word, stigmatizing one who abandons the Church of England, or one of the other Protestant churches, for the Roman Catholic Church. *Apostate* is a strong term for an utter, conspicuous, and presumably base renouncer of the Christian religion, or of any denominational, political, or other faith and affiliation. A *renegade* is one who, presumably without conversion of mind or heart, and from sheer interest, goes over from one faith or party to another; hence, a mere runaway or deserter. The term covers as much abhorrence and reprobation as *apostate*, and more contempt.

St. Paul makes a difference between those he calls *neophytes*—that is, newly grafted into Christianity—and those that are brought up in the faith. *Bacon*, Speech on the Union of Laws.

3. [*cap.*] An assembly of the clergy of the Church of England for the settlement of certain ecclesiastical affairs. There are two Convocations, viz., of the provinces of Canterbury and York, summoned by writs from the crown to the archbishops. Each body contains an upper house of bishops with the archbishop as president, and a lower house, composed of deans, archdeacons, and elected proctors. Constitutions for both Convocations were established in the thirteenth century; later an unsuccessful attempt was made to incorporate them with Parliament. In 1533, by the Act of Submission, their legislative powers were restricted, and their acts have since been dependent upon special warrant from the crown. The Convocation of Canterbury was the more important and regular; but after its prorogation in 1717, although its meetings were continued for a time, it received no new royal warrant till 1861. The Convocation of York has generally been less regular in its proceedings than that of Canterbury. Both Convocations now meet at each parliamentary session, and the proctors are renewed at each parliamentary election.

In England, the Ecclesiastical body called the *Convocation*, which grew up in the reign of King Edward I., gradually attained the position which had been formerly occupied, and executed some of the functions which had formerly been discharged, by Provincial Synods, consisting of Bishops. *Bp. Chr. Wordsworth*, Church of Ireland, p. 204.

The *convocations* of the two provinces, as the recognised constitutional assemblies of the English clergy, have undergone, except in the removal of the monastic members at the dissolution, no change of organisation from the reign of Edward I. down to the present day.

2. In *math.*, a magnitude belonging to a system of magnitudes serving to define the positions of points, lines, planes, or other spatial elements, by reference to a fixed figure; hence, also, a magnitude of a system serving to define the elements of a continuum, in general, as geometrical coördinates do positions in space: thus, the latitude, the longitude, and the height above the mean sea-level are the three *coördinates* commonly used to define the position of a meteorological station. See *Cartesian*.

Areal coördinates, a special variety of trilinear coördinates, consisting of the areas of the three triangles having the variable point for a common vertex, and the other vertices two of the three fundamental points. These areas are taken as affected by such algebraical signs as to sum up to the area of the fundamental triangle.—**Axes of coördinates.** See *axis*[1].—**Barycentric coördinates.** See *triangular coördinates*, below.—**Biangular coördinates**, the two angles PAB and PBA, where P is a variable point in a plane, while A and B are fixed points. Sometimes the cotangents of these angles are taken as the coördinates.—**Bicircular coördinates**, two quantities serving to define the position of any point in a plane by reference to two series of circles which cut one another under a constant angle. There are two principal kinds of bicircular coördinates. In the first kind, a point having been assumed whose coördinates are to be infinite, two lines are drawn through it (commonly at right angles), and all the coördinate circles have their centers on these lines and pass through their intersection. One circle of each of these series passes through the variable point. If *a* is the distance from the point of infinite coördinates at which either of these circles passes through the line of centers of the circles of the same series, the corresponding coördinate is $A+1/a$, where A is a constant belonging to this coördinate. In the second kind two fixed points, A and B, are assumed. Then, every circle of one series passes through both the points A and B, while each of the second series has its center on the line AB, and cuts all of the first series orthogonally. One coördinate is the angle at A between the line AB and the circle of the first series passing through the variable point, while the second coördinate is $P + Q\log(1/s + 1/8)$, where *s* is the distance from A to the point at which the circle of the second series passing through the variable point cuts the line AB, S is the distance AB, and P and Q are arbitrary constants.—**Bilinear coördinates.** (*a*) Same as *vectorial coördinates*. See below. (*b*) Cartesian coördinates, or tangential coördinates based on Cartesian coördinates.—**Binary coördinates**, non-homogeneous coördinates of points or lines in a plane.—**Bipunctual coördinates**, coördinates fixing the positions of points or lines in a plane by reference to two fixed points and a fixed direction of measurement. Bipunctual coördinates are of two kinds, line coördinates and point coördinates. Bipunctual line coördinates are the distances of a variable line from two fixed points measured in a constant direction. Bipunctual point coördinates are, each, the negative of the reciprocal of the distance measured in a fixed direction (the same for both coördinates) from one of two fixed points of the line joining the variable point to the other fixed point. In the figure, S and T being the two fixed points, SM and TN are the coördinates of the line MN; and the negatives of their reciprocals are the coördinates of the point P, the intersection of MT and SN.—**Boothian coördinates** [named after their inventor, the English mathematician James *Booth*], rectangular tangential coördinates. See *tangential coördinates*, below.—**Cartesian coördinates.** See *Cartesian*.—**Curve coördinates**, coördinates defining curves.—**Curvilinear coördinates**, quantities used to define the positions of points on a given curved surface.—**Elliptic coördinates**, a system of coördinates for defining curves upon an ellipsoid by means of the intersections of two systems of confocal hyperboloids.—**Generalized coördinates**, in *analytical mech.*, any system of quantities serving to define the positions of the particles of a system, and treated in a general manner without specifying what they are.—**Homogeneous coördinates**, a system containing one coördinate more than is sufficient for defining the spatial element. One fixed non-homogeneous equation subsists between the coördinates, and every other equation between them is taken as homogeneous.—**Ignoration of coördinates**, the leaving out of account of some of the coördinates of a complicated mechanical system: an omission which is permissible under certain circumstances. Thus, in the kinetical theory of gases the coördinates of the individual molecules are not considered.—**Isothermal coördinates**, any pair of quantities serving to define the positions of points in a plane by means of two series of curves cutting one another at right angles.—**Line coördinates**, a homogeneous system of six coördinates fixing the position of a variable line in space.—**Oblique system of coördinates**, in *analytical geom.*, a system in which the coördinate axes are oblique to each other.—**Origin of coördinates**, a point whose coördinates are equal to zero; the intersection of the axes of coördinates.—**Orthotomic coördinates**, a system of three quantities determining the positions of points in space by reference to three series of surfaces cutting one another orthogonally.—**Point or punctual coördinates**, such coördinates as determine the positions of points.—**Polar coördinates in a plane**, a system of coördinates consisting of a radius vector, or the length of a line from the variable point to be defined to a fixed point termed the *origin*, and a vectorial angle, or angle between the radius vector and a fixed line through the origin, called the *initial line*, or polar axis.—**Polar coördinates in space**, a system of coördinates consisting of a radius vector, a plane vectorial angle, and a dihedral angle. A radius vector and three direction-cosines used to determine the position of points in space are also sometimes called polar coördinates.—**Quadriplanar coördinates**, homogeneous point coördinates in space defining a variable point by its distances from four fixed planes, these distances being measured in fixed directions.—**Rectangular coördinates**, a system of quantities serving to determine positions by a reference to two axes in a plane, or three in space, which cut one another at right angles.—**Rodrigues's coördinates**, a certain system of quantities serving to define the position of a rigid body which has one point fixed. Such a body can be brought from any assumed position to any possible position by means of a rotation round an axis through the fixed point. Three of Rodrigues's coördinates are the direction-cosines of this axis, and the fourth is the angle of rotation.—**Spherical coördinates**, quantities analogous to latitude and longitude, used to determine the positions of points on a given sphere.—**Tangential coördinates**, coördinates defining the positions of lines in a plane or of planes in space.—**Tetrahedral coördinates**, or **barycentric coördinates in space**, quadriplanar coördinates whose fixed equation is

$$x + y + z + w = \mathrm{T},$$

x, *y*, *z*, *w* being the coördinates.—**Triangular** or **barycentric coördinates**, trilinear coördinates the fixed equation of which is

$$x + y + z = \mathrm{T},$$

where *x*, *y*, *z* are the coördinates.—**Trilinear coördinates**, a system of homogeneous coördinates defining the positions of points in a plane in which the fixed figure of reference is a triangle, called the fundamental triangle or triangle of reference, and the coördinates are the distances of the variable point from the sides of this triangle measured in three fixed directions.—**Vectorial coördinates**, the distances of a variable point in a plane from two fixed points. Also *bilinear coördinates*.

Some of the softer kinds are also called *anime*. Copal may be dissolved by digestion in linseed-oil, with a heat a little less than sufficient to boil or decompose the oil. This solution diluted with spirit of turpentine forms a beautiful transparent varnish, which, when properly applied and slowly dried, is exceedingly durable and hard. There are various methods of preparing it. The most highly prized copal is that obtained from Zanzibar and Mozambique, the product of leguminous trees, *Trachylobium Hornemannianum* and *T. Mozambicense*, and often dug from the ground in a semi-fossil state. Several varieties are obtained from the western coast of Africa, all probably furnished by species of *Copaiva*. Manila or Indian copal is obtained from *Vateria Indica*. Kauri copal, from New Zealand and New Caledonia, is found in the soil in large masses, the product of species of the genus *Dammara*. South American copals are obtained from *Hymenæa Courbaril* and other allied leguminous trees, as well as from some burseraceous species. (See *anime*.) As distinguished from the chasuble, the cope is a processional or choral vestment, while the chasuble is sacrificial or eucharistic. In the Church of England the cope was sometimes used instead of the chasuble, and at the time of the Reformation the chasuble itself was often called a cope. The 24th canon of 1603 (still in force) orders the cope to be worn by the celebrant in all cathedral and collegiate churches. It continued to be worn at the eucharist and at other times till the middle of the eighteenth century, especially in cathedrals, but had fallen gradually more and more into disuse till revived in recent times. A decision of the judicial committee of the Privy Council in 1871 limited its use to that enjoined in the canon of 1603. In England in the middle ages a long open black mantle sewn together in front over the neck and chest was worn by canons, and called the *canon's cope*. See *mandyas* and *pluvial*.

Chemical symbol, Cu; atomic weight, 63.57. A metal distinguished from all others by its peculiar red color. Its crystalline form is that of the cube or regular octahedron (isometric). Its specific gravity is nearly nine times that of water (8.838 native copper, 8.945 electrotype copper). Among the metals in common use, it stands next to gold and silver in malleability and ductility, and next to iron and steel in tenacity. Its melting-point is a little above that of gold and considerably above that of silver. Copper is one of the most widely diffused metals, and occurs in the native state, as well as in a great variety of sulphureted and oxidized combinations. Native copper is not infrequently met with in the superficial portions of cupriferous lodes, but usually only in small amount. In two regions, however, this metal is mined exclusively in the native state: namely, the south shore of Lake Superior, and Corocoro in Bolivia; but of the two the former is by far the more important, and produces a large part of the total yield of the world. In the Lake Superior region the copper occurs in regular fissure-veins, and also in a conglomerate of volcanic origin, forming the cement by which the pebbles are held together. In the fissure-veins large masses of native copper have frequently been found, one such mass weighing over three hundred tons. Most of the copper of the world, previous to the opening of this region, was produced from ores consisting of combinations of the metal with certain mineralizers, such as sulphur and oxygen, and especially sulphur. The most abundant ore is the "yellow copper ore" or copper pyrites, which is composed of copper, iron, and sulphur, and contains, when chemically pure, 34.6 per cent. of copper. The copper production (smelter output) of the world for the year 1911 was 1,958,201,285 pounds; and that of the United States, 1,097,232,749 pounds. The copper of the United States comes chiefly from Arizona, Montana, Michigan, and Utah. Mexico, Spain, Chile, and Australia are other large producers of this metal. Copper has been known from the remotest ages, and was mined extensively on Lake Superior before the advent of Europeans. Its uses are manifold. The most important of them was, before the very general use of iron in ship-building, as a sheathing metal, first by itself, and later as a part of the alloy called *yellow metal,* a variety of brass. On account of its electric conductivity, copper is largely used for induction-coils and all kinds of electrical apparatus, and for the cores of telegraph-cables. For these uses very pure copper is required; very slight impurity greatly increases its electrical resistance. For domestic purposes copper is made up in a great variety of forms, either by itself, or tinned in order to prevent corrosion by acid liquids. The electrotyping process depends on the deposition by the galvanic current of pure copper from a solution of one of its salts, the metal deposited forming an exact reproduction in copper of an object suspended for that purpose in the bath. The alloys of copper are of great importance, and one of them, bronze, is of high antiquity. The salts of copper are also numerous, and are invaluable in the arts. Copper sulphate, or blue vitriol, is largely used in calico-printing, in electro-metallurgy, and in the preparation of the copper pigments Scheele's green, Schweinfurt green, and Paris green, the latter being much used as an insecticide, principally for the Colorado potato-beetle. See *brass, bronze,* and *yellow metal* (under *metal*).

2. A vessel made of copper, particularly a large boiler; specifically, in the plural, the large kettles or boilers in a ship's galley for boiling food for the ship's company. copyhold (kop'i-hōld), *n.* [< *copy* + *hold*.] **1.** In England, a tenure of lands of a manor, according to the custom of the manor, and by copy of court-roll; or a tenure for which the tenant has nothing to show except the rolls made by the steward of the lord's court, which contain entries of the admission of the original or former tenant, his surrender to the use of another, or alienation, or his death, and the claim and admission of the heir or devisee. There are two sorts of copyhold: the first is styled *ancient demesne*, or a customary freehold; and the second a *base tenure*, or mere copyhold. Copyhold property cannot be now created, for the foundation on which it rests is that the property has been possessed time out of mind by copy of court-roll, and that the tenements are with the manor. Copyholds now descend to the heir at law, according to the rules that regulate the descent of all other kinds of estate in land.

You're like a *copyhold*, with nine lives in't.

II. *n.* The distal or ventral element of the scapular arch, extending from the scapula to or toward the sternum, of whatever size, shape, or position: so named from the fact that in adult man it somewhat resembles the beak of a crow in size and shape. See cut under *scapula*. In reptiles, birds, and monotrematous mammals the coracoid is a comparatively large, distinct, and independent bone, articulated at one end with the shoulder-blade and at the other with the sternum. (See cuts under *hypocleidium* and *pectoral*.) In all mammals above the monotremes it is much reduced, becoming a mere process of the scapula, firmly ankylosed therewith and having no connection with the sternum, but normally having an independent center of ossification. In amphibians the coracoid varies in condition and relations, but when present conforms to the above definition. In batrachians the coracoid is divided by a large membranous space or fontanel into a coracoid proper, which lies behind this space, a persistently cartilaginous epicoracoid, which bounds the space internally, and a precoracoid in front of it. In fishes the term *coracoid* has been applied to several different parts, on the assumption of their homology with the coracoid of the higher vertebrates (see cut under *scapulocoracoid*): (*a*) by Cuvier and his followers, to the teleotemporal; (*b*) by Owen and others, to the prescapula; (*c*) by Parker and other late writers, to the hypocoracoid; (*d*) by Gill, to the inner cartilage of the scapular arch and the bones into which it is disintegrated in the higher fishes. A general term for the hard calcareous skeleton secreted by the marine cœlenterate polyps for their support and habitation (polypidom). The coral-pro-

ducing zoöphytes are usually compound animals, young buds sprouting from the body of the parent polyp and remaining connected with it on the same spot even after it is dead; so that a piece of coral may be regarded as the abode either of one compound animal or of a multitude of individuals. The coralline structure sometimes branches like a shrub, sometimes spreads like a fan, or assumes the appearance of a brain, a flower, a mushroom, etc. (See cut under *brain-coral*.) These structures sometimes, as in the Pacific and southern parts of the Indian ocean, form reefs from 20 yards to several miles in breadth, extending for hundreds of miles along the coasts, and also the peculiar coral islands known as *atolls*. (See *atoll*.) The more abundant reef-builders, at the more

moderate depths, are the madrepores, astræids, porites, and meandrines, and, at depths of from 15 to 20 fathoms, the millepores and seriatopores — the great field of coral-development thus lying between low water and 20 fathoms. Coral is nearly a pure calcium carbonate, mixed with more or less horny or gelatinous matter. The fine red coral of commerce, much used for ornaments, is a sclerobasic coral, in appearance somewhat resembling a tree deprived of its leaves and twigs. It is found chiefly in the Mediterranean, where several coral fisheries exist, as off the coasts of Provence, Sardinia, etc. See *Coralligena*, *Corallium*, *Octocoralla*, *Sclerobasica*, *Sclerodermata*.

The mouth always has one or more circlets of tentacles, slender and conical, or short, broad, and fimbriated. The enterocœle is divided into 6, 8, or more intermesenteric chambers communicating with cavities in the tentacles; the mesenteries are thin and membranous, each ending aborally in a free edge, often thickened and folded, looking toward the center of the axial chamber; and the outer wall of the body has no large paddle-like cilia. rise by gemmation to zoanthodemes of various shapes. The great majority have a hard skeleton, composed chiefly of carbonate of lime, in some of its forms known as *coral*, which may be deposited in spicula in the body, or form dense networks or plates of calcareous substance. The chief divisions of the *Coralligena* are the *Hexacoralla* and the *Octocoralla* (or *Alcyonaria*). The *Coralligena* include all the *Actinozoa* which form coral, and many which do not, as the sea-anemones, dead-men's-fingers, etc. Nearly all "corals" of ordinary language are hexacoralline; not, however, the red coral, with which the name is most popularly associated.

> The Actinozoa comprehend two groups — the *Coralligena* and the Ctenophora. . . . In the *Coralligena* the outer wall of the body is not provided with bands of large paddle-like cilia. *Huxley*, Anat. Invert., p. 138.

There is a hard homogeneous sclerobasic axis, on which the value of the coral depends. There are eight pinnately fringed tentacles and other characters separating the family so widely from most corals that it does not belong to the same order, but to the alcyonarian or octocoralline division of the *Coralligena*, many of which are not coralligenous; and its affinities are with the gorgoniaceous polyps, as the sea-fans, etc. See *Corallium*, *Coralligena*.

It forms a reddish-green mass which yields a yellow powder, consisting of aurin ($C_{19}H_{14}O_3$) with other similar substances. It is insoluble in water, but soluble in hydrochloric acid and alcohol. Its presence in articles of clothing has sometimes caused serious cutaneous eruptions. Red corallin, or peony-red as it is sometimes called, is produced from yellow corallin by the action of ammonia at a high temperature.

The skeleton thus formed, freed of its soft parts, is a "cup coral," and receives the name of a *corallite*. . . . The *corallites* may be distinct and connected only by a substance formed by calcification of the cœnosarc, which is termed cœnenchyma; or the thecæ may be imperfectly developed, and the septa of adjacent *corallites* run into one another. *Huxley*, Anat. Invert., p. 139.

corban (kôr′ban), *n.* [Heb. *korbān*, an offering, sacrifice, < *karab*, approach, bring, offer. Cf. *corbana*.] **1.** In *Judaism*, an offering of any sort to God, particularly in fulfilment of a vow. To the rules laid down in Lev. xxvii. and Num. xxx. concerning vows, the rabbins added the rule that a man might interdict himself by vow not only from using for himself any particular object, for example food, but also from giving or receiving it. The thing thus interdicted was considered as corban. A person might thus release himself from any inconvenient obligation under plea of corban—a practice which Christ reprehended, as annulling the spirit of the law.

But ye say, If a man shall say to his father or mother, It is *Corban*, that is to say, a gift, by whatsoever thou mightest be profited by me; he shall be free. Mark vii. 11.

Origen's account of the *corban* system is that children sometimes refused assistance to parents on the ground that they had already contributed to the poor fund, from which they alleged their parents might be relieved.
W. Smith, Bible Dict.

It had cheek-pieces continuous with the back, extending beneath the chin, and separated in front by a narrow opening in part closed by a nasal and extending to the eye-holes. The convex upper portion projected beyond the lower portion, and commonly bore the long upright crest of the usual form. When the wearer was not in action the helmet was pushed back on the head for greater comfort, the cheek-pieces resting on the forehead.—**Corinthian order**, in *arch.*, the most ornate of the classical orders, and the most slender in its proportions. The capital is shaped like a bell, adorned with rows of acanthus-leaves, and less commonly with leaves of other plants. The usual form of abacus is concave on each of its sides, the projecting angles being supported by graceful shoots of acanthus, forming volutes which spring from *caules* or stalks originating among the foliage covering the lower part of the capital. These caules also give rise to lesser stalks or *cauliculi*, and to the spirals called *helices*, turned toward the middle, and supporting an anthemion or other ornament in the middle of each side of the abacus. In the best Greek examples the shaft is fluted like the Ionic, and the base called Attic is usual. The entablature also resembles the Ionic. The Corinthian order is of very early origin, though it did not come into favor among the Greeks until comparatively late. The legend of the evolution of the Corinthian capital by Callimachus, in the fifth century B. C., from a calathus (woman's basket) placed on a maiden's tomb and covered with a tile, about which the leaves of a plant of acanthus had grown, is a fable. Among notable Greek examples of the order are the Tholos of Polyclitus at Epidaurus (fifth century B. C.), the choragic monument of Lysicrates at Athens (335–4 B. C.), and the temple of the Olympian Zeus at Athens, finished by Hadrian. The rich character of the order commended it to the Romans, who, as well as their followers of the Renaissance, used it freely, and modified it in accordance with their taste.—**Corinthian pottery**, Corinthian ware. See *Corinthian style.*—**Corinthian style**, in ancient Greek vase-painting, an early style, existing prior to the black-figured style proper, the decoration being taken directly from Oriental embroideries and similar work. A large totipalmate swimming and diving bird of the family *Phalacrocoracidæ* (which see for technical characters). There are about 25 species, of all parts of the world, much resembling one another, and all usually comprised in the single genus *Phalacrocorax*. They are mostly maritime, but some inhabit fresh waters; they are gregarious, and in the breeding season some species congregate by thousands to breed on rocky ledges over the sea, or in swamps, building a rude bulky nest, and laying from 1 to 3 whole-colored greenish eggs coated with a white chalky substance. Their principal food is fish, and their voracity is proverbial. The common cormorant of America, Europe, and Asia, *Phalacrocorax carbo*, which may be taken as the type of the whole, is about 3 feet long and 5 in extent, with a heavy body, long sinuous neck, a stout hooked bill about as long as the head, a naked gular pouch, stout strong wings, and 14 stiff tail-feathers denuded to the bases. The color is lustrous black, bronzed on the back, where the feathers have black edges; the feet are black; in the breeding season there is a white flank-patch; and on the head are scattered white thready plumes. The same or a similar species is domesticated by the Chinese and Japanese and taught to fish. A smaller species, the crested cormorant, *P. cristatus*, is found in Europe, and is known as the *shag*, a name also used for cormorants at large. The commonest North American species is the double-crested cormorant, *P. dilophus*, having only 12 tail-feathers (the number usual in the genus), the gular sac convex behind, and a crest on each side of the head. The Florida cormorant, which breeds by thousands in the mangrove swamps, is a variety of the last. On the Pacific coast of the United States several other species occur, as the violet-green cormorant (*P. violaceus*), the red-faced (*P. bicristatus*), the tufted (*P. penicillatus*), and others. The Mexican cormorant, *P. mexicanus*, is a small species which extends into the United States. A few species are largely white, and others are spotted.

In every illuminated manuscript of the Anglo-Saxon period, each figure of a saint we behold with a circle of glory round the head. For such a disk of golden brightness, "nimbus" is the modern, *corona* the olden name.
Rock, Church of our Fathers, III. i. 147, note.

During a total solar eclipse, when the sun is obscured by the moon's shadow, the dark disc is seen to be surrounded by a "glory," or fringe of radiant light, which is called the *corona*. *Huxley*, Physiography, p. 367.

The *corona* as yet has received no explanation which commands universal assent. It is certainly truly solar to some extent, and very possibly may be also to some extent meteoric. *C. A. Young*, The Sun, p. 19.

In the larger and richer examples, however, the general disposition only is circular, this form being broken by lobes, cusps, and the like, along which the lights are arranged. The bounding line is usually marked by a broad band of metal, ornamented with repoussé work, enamel, etc., and having sacred texts inscribed upon it; to this band the separate candlesticks are attached. Also called *corona*.—**Corona nuptialis**, a nuptial crown; a crown placed upon the head of a bride or groom at the time of the marriage ceremony. In the marriage rite in Western churches this usage is to be traced only in the wreath worn by the bride; but in the Greek, the Coptic, and other Oriental churches, both bride and groom wear crowns of metal, and among the Armenians each wears a wreath of flowers.

II. *intrans.* To be reciprocally related; have a reciprocal relation with regard to structure or use, as the parts of a body.

★**correlate** (kor'ē-lāt), *a.* and *n.* [= Sp. *correlato*, < ML. **correlatus*, pp. adj.: see *correlate*, *v.*] **I.** *a.* Reciprocally related in any way; having interdependence, interconnection, or parallelism in use, form, etc.; correlated: as, the *correlate* motions of two bodies.

II. *n.* The second term of a relation; that to which something, termed the *relate*, is related in any given way. Thus, *child* is the correlate, in the relation of *paternity*, to *father* as relate.

Whatever amount of power an organism expends in any shape is the *correlate* and equivalent of a power that was taken into it from without. *H. Spencer*, Prin. of Biol., § 23.

Freedom is consequently the necessary *correlate* of the consciousness of moral law.
Adamson, Philos. of Kant, p. 116.

★**correlation** (kor-ē-lā'shọn), *n.* [= F. *corrélation* = Sp. *correlación* = Pg. *correlação* = It. *correlazione*, < ML. *correlatio(n-)*, < **correlatus*, reciprocally related: see *correlate*, *v.*, and *relation.*] **1.** Reciprocal relation; interdependence or interconnection.

The term *correlation*, which I selected as the title of my Lectures in 1843, strictly interpreted, means a necessary mutual or reciprocal dependence of two ideas, inseparable even in mental conception; thus, the idea of height cannot exist without involving the idea of its correlate, depth; the idea of parent cannot exist without involving the idea of offspring. *W. R. Grove*, Corr. of Forces, p. 183.

There is a *correlation* between the creeds of a society and its political and social organization.
Leslie Stephen, Eng. Thought, i. § 13.

2. The act of bringing into orderly connection or reciprocal relation.

If there exists any chief engineer of the universe, who knows all its powers and properties, such a person could work miracles without end, by new *correlations* of forces and matter. *Dawson*, Nature and the Bible, p. 32.

3. In *biol.*, specifically, the interdependence of organs or functions; the reciprocal relations of organs.

Every movement in a muscle presupposes the existence of a nerve; and both of these organs presuppose the existence of a nutrient system. In this way one function has an intimate connection with other apparently dissimilar functions. This relation . . . is known as *correlation*. *Gegenbaur*, Comp. Anat. (trans.), p. 57.

Some instances of *correlation* are quite whimsical: thus, cats which are entirely white and have blue eyes are generally deaf. *Darwin*, Origin of Species, p. 26.

It is an ascertained fact, that when one part of an animal is modified, some other parts almost always change, as it were in sympathy with it. Mr. Darwin calls this "*correlation* of growth."
A. R. Wallace, Nat. Select., p. 310.

4. In *geom.*, such a relation between two planes that to each intersection of lines in either there corresponds in the other a line of junction between points corresponding to the intersecting lines in the first plane; also, a relation between two spaces such that to every point in either there corresponds a plane in the other, three planes in either intersecting in a point corresponding to the plane of the three points in the other space to which the three intersecting planes correspond; more generally, a relation between figures, propositions, etc., derivable from one another in an *n*-dimensional space by interchanging points with (*n*—1)-dimensional flats.—**Correlation of energies** or **forces.** See *energy.*

★**correlative** (kọ-rel'a-tiv), *a.* and *n.* [= F. *corrélatif* = Sp. Pg. It. *correlativo;* as *correlate* + *-ive;* or < L. *cor-* + *relativus*: see *correlate* and *relative.*] **I.** *a.* **1.** Being in correlation; reciprocally related or connected; interdependent; mutually implied.

Man and woman, master and servant, father and son, prince and subject, are *correlative* terms.
Hume, Essays, xi., note 10.

Under any of its forms, this carrying higher of each individuality implies a *correlative* retardation in the establishment of new individualities.
H. Spencer, Prin. of Biol., § 326.

2. In *gram.*, having a mutual relation; answering to or complementing one another. Thus, *either* and *or*, *where* and *there*, are correlative conjunctions; *the one* and *who* are correlative pronouns; Latin *quantus* and *tantus* are correlative adjectives.—**Correlative figures,** figures derivable from one another by substituting for every point connected with either a plane similarly connected with the other.—**Correlative method,** in *geom.*, the method of deriving projective theorems by substituting in known propositions "plane" for "point," and conversely.—**Correlative propositions,** in *projective geom.*, propositions either of which is converted into the other by substituting throughout "point" for "plane," and "lying in" for "intersecting in," and conversely. Thus, the following propositions are correlative: any two lines which intersect in a point lie in one plane; any two lines which lie in one plane intersect in a point.—**Correlative terms,** a pair of terms implying a relation between the objects they denote, as *parent* and *child.*

II. *n.* Either of two terms or things which are reciprocally related; a correlate. Careful writers distinguish the terms as *correlatives*, the things as *correlates.* In the medieval Latin, which has greatly influenced English terminology, this distinction is constantly maintained.

Difference has its *correlative* in resemblance: neither is possible without reflecting the other.
G. H. Lewes, Probs. of Life and Mind, II. ii. § 14
